The final problem is the arguments. I'll assume they are passed on the stack (else you'll most likely need an assembler binding) so you (iirc) will need cdecl (or is it _stdargs) preceeding it along the lines of: "void _stdargs (*Cpu_Mod)()". This will stack the arguments right-to-left; if the module expects them left-to-right then unless you have something similar to the MWC "alien" keyword you'll have to resort to assembly again.

Clear as mud eh? <G>

[can't be much clearer without more details]

Oh? Under what conditions? I couldn't reproduce the bug.

I tried appl_exit(), but it doesn't close ACC windows (under TOS/AES
1.4).

That's great. Thanks for the information. The function wind_new was
there all the time for me to use, but I wasn't aware of it :) It is
especially nice, because it _does_ take care of accessory windows,
unlike appl_exit();

Hm. I have PureC 1.0 and there's no appl_getinfo().

Another question (since you know so much): Is there a way, under TOS
(and AES) 1.4, to find out which window is currently at the bottom?

It's rather unfair to call this a bug - it just means that you have not
understood how the shell handles wild cards. Remember, unix does not
stop you doing stupid things, since this would stop you doing clever things.
It would be quite possible to write a shell in which the above command
behaved in the way that you expect it to. On the other hand, you could do:

mv *.c subdir

from any normal shell, which results in the required behaviour. (As long as subdir already exists as a directory.)

>Given that MiNT is very Unix like, are there any other killer bugs?

Watch out for 'rm -rf *' !

Really, there are lots of 'gotchas' on a unix-like system which, for quite logical (and sometimes illogical) reasons, don't behave as one might expect. A basic book introducing unix concepts is invaluable. You might also try the comp.unix.questions FAQ.

Hi!

Can anybody tell me what's wrong with the following piece of code?

```
   if (appl_find("V-CONFIG") < 0)
      Pexec(100,"V-CONFIG.PRG","",NULL);
```

It looks OK, but when the child exits it leaves a "empty" process, with size 0 and status EXIT. These processes goes away as soon as the parent exits. I don't know much about how GEMDOS launches programs, but it looks almost like the basepage isn't freed until the parent/caller exits. There's nothing in the Atari Compendium that indicates that the caller must do someting like this in mode 100?

BTW. I', running MiNT 1.14 and N.AES 1.1.

I'm using an atari 1040st for the sequencing program Cubase. While I was trying to make a copy of Cubase for a friend, suddenly a tos error#34 message appeared on the screen. I can't start Cubase anymore but other programs are still running, although they seem a bit slow. Also, starting up my computer has slowed down a bit.

Is my Cubase disc just damaged, or are the problems more serious? Any suggestions?

Thanks, jj

I think the tos.h comes from TurboC/PureC and is therefore copyrighted.
Try to find any other libc (MiNTLib, Sozobon's libc...) on ftp and get
osbind.h, maybe tos.h. These should hold the defines.

For aes.h and vdi.h I would recommend you get the gemfast-library and take
aesfast.h, gemfast.h, aesbind.h and vdibind.h as replacements. They will
work, at least if you define the TurboC-compatibility macro before
including gemfast.h.

Sorry, this is just for the sources. To understand what the library
functions do you should get one of the popular hypertexts. Have a look on
ftp for subdirectories "info", "hypertext", ... Maybe somebody else can
point you out particular documents, I can't...

Ciao

Guido

If it is not found you need to set the path to the program.
With your code the program you are starting must be in the same path as
your own program was started from.
Then it is good to know the process-id of the process
it is good to know for killing the process or knowing when it terminates.
To not get problems with minix filesystem use lowercase in filenames.

Example:

```
   if (appl_find("V-CONFIG") < 0)
   {
      pid = Pexec(100,"C:\\v-config.prg","",NULL);
      if(pid <= 0)
      {
         printf("Error ... \n");
      }
   }
```

Best regards
Erik Hall

I'm at complete loss with this problem, and desperately need help :)

I want to display some text in a window, and reverse image any lines that the user drags the mouse over. ie. like in a text editor..

I know how to display the text using v_gtext, but am at a complete loss as to how to reverse image it.

How do you do this? What VDI opcodes should I be using?

TIA, Gary

- Obtain the rectangle into which your displayed text is contained.
- Draw a black rectangle at the same place in XOR mode.

That's it.

Regards.

The "empty" processes (the official name is "zombie" processes :-))
are placeholders in MiNT's process table that keep around statistics
about the processes (exit code, resource usage, etc.). Many parent
programs wish to be able to gather such information, which is

done with the various Pwait*() system calls.

There are three ways to solve your problems:

(1) use Pwait() to collect the information; or
(2) use Psignal(SIGCHLD, SIG_IGN) to indicate to MiNT that your program
    doesn't care about child exit statuses; in this case the zombie
    processes are never created (this may be the easiest solution for you)
(3) use shel_write() to create the processes rather than Pexec(); then
    collecting exit statuses is the AES's problem. This will only
    work with MultiTOS and similar multitasking AESes.

It should be fairly easy to write a frames manager within a GEM window. The GEM window frame is simply an object tree. You could add another object tree inside the GEM window frame to handle the multiple slide bars, etc.

The frame manager must intercept mouse button events which hit on the frame object tree, and may in turn generate redraw and slider events for specific frames. I believe you can use appl_write() to send messages to yourself, so the only problem would be inventing a new message type (WM_FRAME) and the 8 message limit on the AES queu.

OTOH, you could just make the code Geneva specific.

It's done in two steps: First, write the text normally. Second, XOR
a solid black bar over it.

josdb@xs4all.nl (Jos den Bekker) said:-

>Hm. I have PureC 1.0 and there's no appl_getinfo().

It should be possible to write your own with a bit of assembly. Here's
the one I did for Mark Williams C ...

```
#include <crysbind.h>

extern unsigned short  int_in[I_SIZE],
              int_out[O_SIZE];

short appl_getinfo(ap_gtype, ap_gout1, ap_gout2, ap_gout3, ap_gout4)
short    ap_gtype;
short    *ap_gout1,
     *ap_gout2,
     *ap_gout3,
     *ap_gout4;
{
     int_in[0] = ap_gtype;
     int_out[0] = crys_if( APPL_GETINFO );
     *ap_gout1 = int_out[1];
     *ap_gout2 = int_out[2];
     *ap_gout3 = int_out[3];
     *ap_gout4 = int_out[4];
     return int_out[0];
}
```

Naturally, you won't be able to copy this verbatim (due to crys_if()
probably) but it shows the general idea.

This is called a zombie process. You have to set up a signal handler to catch
signal SIG_CHILD. The easyest way to do this is to so something like

Psignal(SIG_CHILD, SIG_IGNORE) -- it's something liek that. Look in the Atari Compendium under the GEMDOS/MiNT 'Psignal()' sort of area and you'll find the one you need. All you have to do is make your process ignore the SIG_CHILD signal.

: There's nothing in the Atari Compendium that
: indicates that the caller must do someting like this in mode 100?

It's not easily found -- look under Pwaidpid() and other associated calls (they are all together since they are in aplhabetical order). From this you can find out why zombie processes exist: when a child process terminates, MiNT holds the process structure in memory until the parent has been given the child's exit code. The various different Pwaidpid() calls can check for any temrinated children, stopped children, etc... There is a variant that checks only for a particular child.

Come to think of it... I may be wrong about having to simply ignore the SIG_CHILD signal (it is sent whenever a child process terminates). You may have to setup a signal handler that does a Pwaidpid()... Best bet is to check the compendium.

Hope this is of some help.

Cheers,

James Cox.

The problem is not to start the child, but to get it to exit properly.
Somebody suggested that I'd use shel_write() instead, perhaps that
works better.

>To not get problems with minix filesystem use lowercase in filenames.

A good tip, but it's not necessary when the program runs in the
TOS-domain. However, mine is running in the MINT-domain so perhaps I
should do this...

Does anyone know where I can get source code for the Atari ST version of the Computereyes black and white digitizer? I've checked with the manufacturer, and although they used to make the code available for developers a decade ago, they have since lost track of it. I've done a disassembly of the driver program, but without docs it's too difficult to decipher. Any help is appreciated. Thanks.

Hi To all on csap

I'm a bit new to this programming malarky, and am starting off by doing a resource code translation from German to English. I've got ORCS, and although it is dead easy to use it is fouling up on one of the menu items....It's a PCB CAD package, and it has a list of active and displayed layers as part of a pull-down menu. These layers, numbered from 1 to 8 are normally all on the same line, however the mere act of opening the .RSC with ORCS changed that to one number per line, as the layer menu has these numbers on about four times, this took the menu off the bottom of the screen.....Can anyone recommend anything as easy to use as ORCS which might not do this...I'mm going to go through my CDROM collection tonight looking and testing, but any ideas would be welcome....Please reply via email, my newsgroup access can be a bit flaky at the best of times...

chris crosskey

I do this now, but the child's PID isn't equal to the PID returned by Pexec(). Right now I just do it like this:

```
   pppd_pid=Pexec(100, "u:/usr/etc/pppd", "", NULL)+1;
```

It works, but how "legal" is this?

```
>(2) use Psignal(SIGCHLD, SIG_IGN) to indicate to MiNT that your program
>    doesn't care about child exit statuses; in this case the zombie

```

This would be the best solution, but I can't get it to work! If I use Psignal as suggested, I get a "Type mismatch in parameter 'handler'..." error when I try to compile. I'm using Pure C 1.1.

```
>(3) use shel_write() to create the processes rather than Pexec(); then
>    collecting exit statuses is the AES's problem. This will only
>    work with MultiTOS and similar multitasking AESes.
```

I did this in another project I'm working on, and it worked perfectly :-)

Hey Everyone!

Here is a benchtest program that I wrote. It should work on just about everyone's machine, especially Macs running MagiC...

CHECK IT OUT!!! I AM HOPING TO GET A LOT OF FEEDBACK!!!

I would like to post a database of as many different hardware and software combinations as possible. Please let me know any bugs, etc. Further instructions are in the READ.ME and the program itself...

I would love to see results from a Hades...

What about the MiNT/MiNT-net port of X11r5? That worked ok on a standard
ST with 4mb, IIRC...

Anthony

Every time I try and use the VDI call v_get_pixel the values returned
are always 0!! I'm declaring things like this:

```
short vgp,vgc;

v_get_pixel(vhandle,x,y,&vgp,&vgc);
```

It always returns vgp and vgc as 0 :-(

any help would be appreciated...

Hello, I have a problem:
Just recently I bought a Ethernet card for Mega-ST
(Riebel Card without Battery). First it turned out, that DC/DC converter
was broken. Ok, I fixed that.

My Problem: I cannot ftp to another machine.
The error message is: no more sessions.

But I can (without problem)

```
     - ping to another machine
     - telnet to another machine (after some time)
     - ping from another machine (to ST)
     - ftp from another machine (with login into ST)

Therefore I think, HW and connection seems to be ok.
This sounds like a configuration problem to me.

My configuration:
     Mega ST (4 MB),
     Hypercache disabled
     Riebel Card (without Battery)
     Interconnect Software Rev 1.6
     the other computer: NeXTStation

Any idea?
Thank you in advance
Martin

MiNT, that's the key here. If you have launched a child, you need to catch the SIGCHLD signal and use Pwait() to get its return status. Otherwise, it will continue to be listed as a "zombie". There's also a way to turn off SIGCHLD (with Psigmask(), if memory serves me. I'm probably wrong here, though.)

I remember encountering this same problem years ago when I first started writing Geneva. It was so counter-intuitive for this to be on by default (or so it seems to me anyway) that I had to call Eric Smith, who was still working at Atari at the time, to ask him the same question.

Not very legal at all... perhaps the Pure C binding for Pexec is broken?
It should be returning the process id, not the process id - 1.

```
>>(2) use Psignal(SIGCHLD, SIG_IGN) to indicate to MiNT that your program

```

Try casting SIG_IGN to the appropriate type (which you should be able
to determine by looking at your compiler's "mintbind.h" file.
E.g. something like:

```
    Psignal(SIGCHLD, (long) SIG_IGN)
```

may work.

Everyone,

Sorry about posting my program to this and the other two Atari
newsgroups. I have been living in a vacuum over here in the U.S. and I
do not have much experience with the internet. I have been programming
on my own over here since 1989 and I think I have quite a few good ideas
for the Atari and MagiC. Also, I think I could help out with many GFA
problems people have because I've had to figure many of them out for
myself.

COULD ANYONE PLEASE tell me how to remove my BENCHTEST posts and tell me
the CORRECT way to give my program out to anyone that's interested.
Until I wrote this program, I had no idea, for example, which of my
accessories was slowing down my computer and by how much. I could also
see which area were slowed and which were accelerated...

Thanks,

Rob

I don't think you can remove your posts to a newsgroup (could be
wrong...I know that *I* don't know how to do it <g>). I wouldn't worry
about it, it wasn't such a big posting.

I believe there's an atari.binaries newsgroup but you'd need to get
confirmation from someone other than myself.

BTW, I would welocme someone with GFA experience here...I thought I was
the only one using GFA in this newgroup!

Your call looks correct. The only explanation I can think of is a bad binding
of your compiler for v_get_pixel().
Sorry for not being very helpful.

Hi,

I'm having trouble with Lattice C's "Default Short Integers" option on its compiler. This code:

```
main()
{
   char c = -1;

   printf("%d\n", c);
}
```

...seems to print '-1' when I'm in normal, 4-byte-integer mode, but when I change to short integers, it prints -65535, or worse, seemingly any other number it thinks of! I can see how -65535 has a certain logic to it, but what about results such as 1, or 3, or 2, which I've also gotten?

If anybody can help with this, I'd appreciate it greatly! I'm trying to get some solid C code for the CPU_MOD ASM routine, but it's difficult to check for an error code of -1 when Lattice isn't handling -1 correctly!

Pexec returns the pid of the zombie-process, the actual process (pppd)
has pid+1, and a ppid of 000.

The Atari Programmer's User Group

Despite saying some quite nice things about ICTARI, the web-site got something of a pasting from Atari Computing. In many ways, I cannot but

agree. As an experiment I've had a go at putting the text from issue 45 on the web-site, 'should spice things up a bit. The picture of the "sad old Atari" will stay put for the time being. ICTARI 45 has some very interesting contribvtions, especially the ones about parallax scrolling in STOS and CAB / STiK. See for yourselves at:

http://www.elis.demon.co.uk/ictari/ictari.htm

See you at the Goodman's shows,

Have Fun,

"Augeas"

Folks, I need some help.

How on earth are one to write and change environment variables under plain TOS/GEM. When MiNT is running it is possible to use the shel_write() function, but this is not available under TOS/GEM.
Is there any GEM calls available for this kind of task or do I have to go direclty on the hardware address?

Regards, Thomas

>has pid+1, and a ppid of 000.

Ah, I know what's going on. /usr/etc/pppd is forking itself and then
running yet another process. Here's the sequence:

your program: Pexec(100)...
   -> pppd 1 (process id "pppd_pid"): fork() to create "pppd 2"
   -> "pppd 1": exit() (leaves a zombie with process id "pppd_pid")
   -> "pppd 2" (process id "pppd_pid + 1"): runs in background

You do *not* want to add 1 to the pid you got back from Pexec. Use it
directly in the Pwait() call so that you can collect the exit status of
the child that turned into a zombie. The other process (which is actually
your process's grandchild) doesn't need to be "waited" for -- this
is indicated by its ppid being 0.

In fact, in this particular case there's no need for you to use Pexec(100);
pppd uses fork() to put a copy of itself in the background, so
Pexec(0) will work just fine (and will save you the trouble of having to
do a Pwait()).

If there are other programs (other than pppd) that you might want to run,
you can still use Pexec(100) + Pwait(), but do *not* add 1 to the pid you
got back; you really do need to do Pwait() on the zombie process to
get rid of it.

Newsgroups: comp.sys.atari.programmer

I ran some benchmarks for different operations to speed up my HiSoft BASIC programs. The following list shows the execution times (in seconds) for a loop with each operation. (about 64000 times)

TIME	OPERATION
5.78	SQR
5.06	DIV
0.41	>> <<
0.38	MULT
0.32	SUB
0.25	ADD

What's interesting here is that division is 13 times slower than multiplication. In fact it is closer to square root than anything else. Why?

Then I changed the global variable declaration using DEFINT a-z, DEFDBL, DEFSNG, and DEFLNG. The first column shows the time using DEFxxx. In the second column only one variable was changed in the loop while the loop itself was integer.(ie FOR x%=1 TO 10000:x#=x#:NEXT x%)

DEFxxx	Single Var	Type
	3.63	String (for reference)
14.13	0.33	Double float
1.30	0.22	Single float
0.42	0.21	Double Integer
0.20	0.20	Integer

I guess this shows that for speed minimal use of single precision floating point isn't bad but it shouldn't be used in frequently called loops. Double precision is a killer. (when talking about speed)

This exercise is of course to speed up graphics. I came to the conclusion to use integers to represent X and Y coordinates multiplied by 50. Then I can do slight increments and divide the results by 50 to get the coordinates back. This seemed to work great until I found how slow division was. Then I thought to use the shift bits left and right operators (<< , >>) to do multiply and divide. But I'm then stuck with the X-coordinate times 32 or <<5 because 32767/640<51.2.

What I mean is that the greatest integer value(32767) divided by the largest coordinate(640) is my multiplier. For me to use >> and << the multiplier must be a power of two. The greatest power of two less than 51.2 is 32 or 2^5. I could use the sign bit and then I get 65536/640<102.4 and the multiplier would be 64 or 2^6. Better resolution.

Any comments would be useful. (with code examples, any language)

In the course of debugging the disambiguator/dispatcher of my Toolbox DLL manager, I have run up against a few hurdles.

If a function call is not allowed in the current Toolbox implementation, (for example the API magic numbers were incorrect, the 16 bit library number or 16 bit library function number are invalid/unimplemented) I want to use the XBRA protocol to call the previous holder of the TRAP vector I use (TRAP number 0, vector $20, exception table offset $80).

However, if this was pointing into a ROM or disc loaded TOS, this will lead to a stream of 32 bombs appearing on the screen, and the calling app to be terminated.

Is there a foolproof way of detecting whether the TRAP vector is pointing into TOS, or has been grabbed by a debugger or other app?

In general, I use the following algorithm when deciding whether to XBRA:

```
  address = previous holder of trap vector
  if address >= $00E00000 AND address < $01000000 then
    it is pointing to the TOS ROM "bomb generator"
    do not XBRA to it
  else if it points to a previous toolbox
    XBRA to it
  else
    who knows?
  end if
```

Hisoft's MON (as supplied with Devpac 3.1, Lattice C 5.60, and probably some of their other products) reprograms "illegal" trap vectors to point into itself. Is there an easy way to detect it (and other) debuggers/bomb

handlers?

As an example of using the Toolbox to call function $259 in library 3, and pass the value $12345678 to it, the API call would be:

```
     move.l   #$12345678,-(sp) ; parameter
     move.w   #$0259,-(sp)  ; function number within library
     move.w   libnum3,-(sp) ; library number
     move.l   #0,d0         ; API (required)
     move.l   #$10,d1       ; API magic (required)
     move.l   d0,a0         ; API (required)
     move.l   d0,a1         ; API (required)
     trap #0        ; call the Toolbox
     add.l    #2+2+4,sp ; fix the stack
```

It is deemed to be a Toolbox call if the four "scratch" registers are set up as zero in D0, A0 and A1 and 16 ($10) in D1. I generally found that it is somewhat unlikely that those registers are going to be in that state when the TRAP #0 handler is called, and now require this as part of the API. There were a few variations in calling sequence and magic numbers earlier on in it's life, but, TTBOMK, none of those were ever released to my beta testers or the users of my custom apps which used the Toolbox and it's Plug-ins or Extensions.

We assume the variable "libnum3" has been initialised with the right value prior to the call. This can be found by calling the library enumeration functions within the Toolbox, or the tlbxHasLib function, and passing the 32-bit "cookie" identifier of the library we are interested in and the return value will be -1 (n/a) or the 16 bit library number.

(The library number is relevant to this session only, and may be different next time. The only pre-known library number which can be relied upon is library number zero - The Toolbox itself)

The Toolbox can currently be detected via XBIOS function $7462. If the return value is $7462 you have no Toolbox. If it returns $544C4258, then it exists.

Are you sure that you have linked your program with the correct library?
Compiling with the short integers option is one thing, linking another one.
Lattice comes with many different libraries, corresponding to the same library
code compiled with different options. You can distinguish between libraries
by their names, see the docs.

Imagine that if you link your main() routine compiled in short integers with
a printf() expecting long integers, this is not going to work...

This is most probably the cause of your problem.

Regards.

shel_write() has nothing to do with MiNT, as it's an AES call. Don't mix
it with the availability of the extended shel_write() call in MultiTOS,
which is also available in Geneva and MagiC, which both don't require
MiNT to run.

> Is there any GEM calls available for this kind of task or do I have to go
> direclty on the hardware address?
There's no AES call to change environment variables, as the AES has its
own environment not necessarily identical to the one the current program
uses. This AES environment shouldn't be changed from an application,
anyway, as it would affect all other applications.

If you want to give a program you want to run from within your
application its own environment variables, there are two ways:

1. Don't use shel_write(), but Pexec() (which you'll need to use for
SingleTOS anyway if you want to keep the calling program running).
Pexec() allows you to pass a pointer to an environemnt.

2. Modify your program's environment (create a copy of the old one,
modify the copy and let p_env of your program's basepage point to it) and
then use shel_write(). Note that this won't work if you use it with the
shel_write() you find in SingleTOS, as it requires to quit the calling
application before the "child" (which is more like a "brother" or
"sister" in that case ;) is run, so the modified environment will not be
used.

Also note that some C-compilers offer the call "setenv", which will ease
the modification of the environment.

Ciao

Thomas

> else. Why?
Because division is quite "expensive". Try to write your own
multiplication routines which multiply two numbers by only using
addition, substraction, bit manipulation and shifting. And then try the same
with division, and you'll see.

You can do all multiplications by splitting one factor in its powers of
two:

x * 29 = x * 16 + x * 8 + x * 4 + x * 1
x * 34 = x * 32 + x * 2

So multiplying is (mostly) a matter of fast shift- and add-operations.

Unfortunately, this doesn't work for division:

x / 29 != x / 16 - x / 8 - x / 4 - x / 1

There are algorithms for division which also only need "basic" operations, but they need a lot more of them than multiplication - that's why it's so much slower. (Of course, the relation between division and multiplication strongly depends on which algorithms are used.)

>
> Any comments would be useful. (with code examples, any language)

If you don't mind using assembly language, you could use "fixed floats", i.e. longs (32 bit) where the upper word represents the integer part, and the lower word the fractional part. I.e. 1.5 would be 0x00018000.

To make a "fixed float" out of normal float variable, simply multiply with 65536 (i.e. 16 shifts to the left). Do the opposite to get the float value back out of such a number.

You can directly add and subtract these "float longs". To multiply two numbers, you have to do a 64-bit multiplication (the reason why you need (or better use) assembly language) and take with middle long out of the result. I.e. 1.5 * 1.5 would be 0x00018000 * 0x00018000, this results in 0x0000000240000000. The middle 32 bits of that are 0x00024000, which is 2.25, the result of 1.5 * 1.5.

Division is a bit more tricky, and I don't have the actual algorithm here. Division by powers of two is easy, of course. Unfortunately, you can't divide by x by splitting x in its powers of two and divide by them, as it's possible for multiplication (see above).

Please excuse me if that's of no use for you.

Ciao

Thomas

This solves one problem, but creates another... I need to know the pid
of pppd in order to...

a) Check that pppd is still running.
b) Kill it when the on-line session is over.

When I use...

```
   pppd_pid=Pexec(100,"/usr/etc/pppd","",NULL)+1;
   Pwait();
```

... I get pppd's pid, this has worked fine so far. But of course, if
another process is started after pppd and before pppd forks() this
will break.

I solved this another way, by starting pppd in the background
(Pexec(100...)) with the parameter "-detach", which prevents it from
forking itself. I then used Pwaitpid() to periodically check that it
still runs.

But how do I get a process' pid? Are there any calls (Like appl_find()
or appl_search() for AES-processes.) that I can use? I tried to browse
the Atari Compendium, but it's so poorly laid-out that it takes

something like 10 minutes to format the gemdos-reference with CAB 1.5
on my 24MHz Falcon...

Hi!

I need to make an accurate clock, and I thought that the 200Hz
system-clock would be the best source. The Pure C helpfile says that
clock() (In time.h) returns this value, while K&R says it returns the
time used by the calling process. After having tried clock(), I
believe K&R are right here.

So I tried to read the clock directly...

```
long *timerptr, timer;

timerptr=0x4ba; /* The 200Hz system-clock is located here */

Super(0);
timer=*timerptr;
Super(0);
```

However, timer is always 0. I'm obviously doing someting very wrong
here, as I'm not quite familiar with how C's pointers work.

a > I'm having trouble with Lattice C's "Default Short Integers"
a > option on its compiler.

a >   printf("%d\n", c);

Variable argument lists, such as used by printf(), convert some
variables (e.g. float to double) before passing them on the stack.
Evidently when using long ints, Lattice C converts shorts to longs,
but not when using short ints.

If printf() is expecting a long and you send it a short, bad things
can happen: -65335 = (-1 << 16) + 0 where the 0 just happened to be
on the stack in the next slot. Just be glad you didn't have any
more arguments in the call (especially string pointers)

As someone else has already posted, you need to link in a version of
printf() which uses short ints.

I want to display a list of fonts currently installed by the system.
Not all those available on disk, but those installed in the ASSIGN.SYS file
or made available via NVDI etc at bootup.

My present code appears to work with NVDI 3+ but fails on bitmap only GDOSs.
Something like:

```
totalfonts = vst_load_fonts(handle, 0);

printf("Total fonts available: %d\n", totalfonts);
totalfonts++;

for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_name(handle, i, fontname);
printf("%-3u  %-5u  %s\n", i, font_id, fontname);
}
vst_unload_fonts(handle, 0);
```

I try to list the fonts by getting the total number via vst_load_fonts() but
this fails under ordinary GDOS 1.1 for instance, returning zero.

So how do I know how many fonts there are?

I also tried
```
for (i = 2, font_id != 1; i ++)
```

on the basis that when vqt_name fails it returns a font_id of 1 any way
which is the system font, so we start at a font above that, hence i = 2.
All I get with this is the system font but works on NVDI 3.

So, can someone lead me through the procedures to list the installed fonts
that works with *all* GDOS versions please?

Slainte mhath

sorry, I was a bit misleading there. Most of the shel_write() functions
is only available with AES 4.0 and above.. which includes MiNT amongst
others.

> There's no AES call to change environment variables, as the AES has its

What I want to do is write a small CPX that allows chaning the _GLOBAL_
environment variables, as the CPX I have for this now is way to buggy. I
am not interested in the environment for the executed task but the one
that is defined as global. You see my need here?

> If you want to give a program you want to run from within your
> application its own environment variables, there are two ways:

As I've staded above this is not what I need. I need to have a way of
accessing the environment vars as other programs like AUTOENVR, ENV.CPX,
and quite a few others do. I am going to set the environment for GEM!

> Also note that some C-compilers offer the call "setenv", which will ease
> the modification of the environment.

Not much use when coding in assembly is it? :)

I just installed Magic 5.03. My WERCS resource editor which comes
with Lattice C gets 68000 exceptions (#-69) whenever I close a dialog.
Both in multi and single tasking modes.

I worked fine on TOS 4.04... Ideas?

John

```

AFAIK C should automatically convert the char you are using into an the default int used, when you're using %d in printf.

If this is not the case, you might want to write:

```
printf("%d\n", (int)c);
```

or maybe

```
printf("%d\n", (short int)c);
```

I'm not sure if any of this helps... oh well...

Greetings,

Tomas

Well, if you know the name of the process, *and* you know that no other
process with the same name can be running, then you can look in the
U:\PROC directory, e.g. with an Fsfirst() for U:\\PROC\\PPPD.*. The
file extension (3 characters) will be the process id, e.g. for
the program C:\USR\BIN\FOO.TTP, with process id 180, U:\PROC will contain
a "FOO.180" entry.

Good enough. If you have two processes with identical names running, there's no practical way of distinguish them without knowing the pid anyway.

Just curios: What happens with pid 1000? I'm running pid 682 now, perhaps I should stay up a couple of hours more and see what happens...

Another idea might be that he's using 32 bit ints and the compiler expects vgp and vgc to be of type int. That would cause both shorts to be zero.

IIRC, the GCC libraries sometimes use 'int' as a type, regardless of whether those are 16 bit or 32 bit. The actual library routines then make things appear correctly to TOS. Any pointers you supply must be to ints, though.

Check the docs of pppd which should tell you the name of the file where it
will write out its pid (perhaps in /var/run/pppd.pid).

I don't think this is a problem. If the magic numbers are not correct, then apparently this was a wild call to trap #0 and you should forward it (with all possible consequences, it's the application's fault anyway). If the magic numbers are correct, but the function number isn't recognized, you should perhaps print a warning and return some error indicator without forwarding the call. This should then be handled in a graceful manner by the application's binding for your toolbox.

That should have worked, except that you should definitely not be doing Super(0) the second time around (you should be using the return value from the first Super(0) call). It's actually a little easier to use the Supexec() function, IMHO:

```
long get_timer(void) {
     return *(long *)0x4ba;
}

main {
  long timer = Supexec( get_timer );
}
```

Geneva does not need MiNT and has the extended shel_write() modes and features, and MagiC also has most of them implemented.

> What I want to do is write a small CPX that allows chaning the _GLOBAL_
> environment variables, as the CPX I have for this now is way to buggy. I
> am not interested in the environment for the executed task but the one
> that is defined as global. You see my need here?

OK. That's a bit tricky. The best method would be to have an auto-folder program like Senf which not only sets initial environment variables for the AES, but also installs a cookie pointing to the basepage of the AES process. The CPX could then use (basepage)->p_env to access and manipulate the global environment.

But don't forget that in most cases this won't have any effect if not the built-in desktop is used, as other desktops have to use Pexec() to launch programs. And there are very little programs which use shel_envrn() to read environment variables, which they would have to use in this case to read the environment set up by the CPX.

> Not much use when coding in assembly is it? :)
Not really. But it's not my fault if you're doing everything in assembly language ;)

Ciao

Thomas

FREE TURNKEY ONLINE BUSINESS

Build a residual income from time you spend on the Internet placing FREE advertisements.

Successful Internet company wants you to help them market their services online. Place FREE advertisements and get paid residual commissions on any sales that you bring to the company. NO cost to start immediately, and all you have to do is place pre-written ads online in your sparetime. Complete training and instructions will be provided to you FREE.

You can even choose to get other online entrepreneurs involved and build your own "sales organization" where you can even earn commissions from the work of others.

You can get started TODAY absolutely FREE, and you can even check the status of your sales ONLINE!

PLEASE WRITE THIS DOWN: GD2854

You will need the above code to join this FREE program.

For more information, retrieve an auto-reply from OVERVIEW@NETOPP.COM,
or visit: http://www.netopp.com.

This message is being brought to you by Dynamic Mail software - the powerful

Hi John,
Have you tried using ORCS?...I know it's a bit crude and you sometimes
have to tell it a menu is a formfield if you don't want it to chew up
the file format, and then change back when you finish, but it's a
fairly easy program to work with, I've used it to translate German
RSC's into English, and I never even read the README.....
Dunno if it is Magic-proof, but it's on most of the Shareware CDROM's,
so you should have it somewhere....

For the next version of PROFILE 2, I'm scanning the U: 'drive' and reporting on the Dpathconf() values returned for each drive and filesystem.

However, it gets to a CDROM and it doesn't like it, sometimes crashing under MagiC 5. This drive isn't listed under pun_info and it also fails a _mediach() check which I perform before getting BPB details which is what I'd expect and normal.

What I need is a way to skip such drives. I thought of Dopendir on U:\M\. Would that fail on a CDROM? Ideas welcome.

The main problem I have is that the problem lies on a beta tester's system that I don't have direct access to.

Hello everyone,

It's me again! Please download my new benchtest program from alt.binaries.atari and I will be completely grateful for any test results that are sent to me. I am going to post a chart that will compare the speed of all Atari computers, and all Atari emulators like MagiC. I want to get as many different computers as possible and as many different options as possible...

I have written a second version for those of you working in the original Atari resolutions (ST LOW) or early TOS (back to TOS 1.0)

So far, I have the following results:

```
(1) 1040ST  TOS 1.0  no accessories       ST LOW
(2) MegaSTe TOS 2.05 8MHz NoCache         ST HIGH
(3) MegaSTe TOS 2.05 NVDI4 8MHz NoCache   ST HIGH
(4) MegaSTe TOS 2.05 16MHz Cache          ST HIGH
(5) MegaSTe TOS 2.05 NVDI4 16MHz Cache    ST HIGH
(6) TT030   TOS 3.05                      TT MED
(7) TT030   TOS 3.05                      TT HIGH
(8) TT030   TOS 3.05 NVDI3                TT MED
(9) TT030   TOS 3.05 NVDI3                TT HIGH
(10) TT030   TOS 3.06                      TT MED
(11) TT030   TOS 3.06                      TT HIGH
(12) TT030   TOS 3.06 NVDI3                TT MED
(13) TT030   TOS 3.06 NVDI3                TT HIGH
(14) Mac Performa 638CD, MagiC, NVDI4      832x624x256 colors
(15) Mac Performa 6230CD, MagiC, NVDI4     640x480x256 colors
(16) Mac Powerbook 145B, MagiC             ST HIGH
(17) Mac Powerbook 190cs, MagiC, NVDI4     640x480x256 colors
(18) Power Mac 9500, MagiC, NVDI4, 21"mon. 1152x870x256 colors
(19) IBM 350/P100, TOS2WIN 95              SVGA
```

BENCHTEST FAQ:

(1) Why is your program better than GEMBENCH?

Well, its not necessarily better, but it is different. I wanted to make a program that simulates actual programs that people use from day to day. I'm not concerned with the time it takes to call a vdi function 10000 times in a row. I'm concerned with stuff like, "Well, how much faster will my word processor be on my Performa running MagiC? How about running in 256 colors on my 19" monitor in 1280x960 resolution?" I have desinged "real-world" tests into this program so I could make some "real-world" comparisons.

(2) Your program won't run on my 1040ST/MEGA4 because I get a dialog that says, "Current screen resolution is unacceptable..."

I have based all of my tests on a stock TT030 with stock hard drive. I have written another version of the program called "E_BENCH2.PRG" for those Atari users with older versions of TOS (back to TOS 1.0) and color monitors. This second version runs in ST LOW. One drawback is that due to the changes I had to make in the tests so they would work in ST LOW/TOS 1.0, the results may be up to 10% different from those produced by the original program. For this reason, please use E_BENCH2 for older Atari computers only.

(3) The program crashes when it gets to "Hard disk write".

It seems that I did not anticipate all possible combinations. (or that many at all really) Please try the following: Run the program from Drive C:, and make sure there is at least 10 megs free on Drive C:. I will try to improve the routine in the future but I have tested it on two different TT030s, 3 different Performas, booting from a syquest EZ135 on a Performa, 2 different Powerbooks, a 9500 Mac, booting off the internal drive, and off a Syquest EZ135, and had no trouble. Someone even emailed me test results from their IBM, running TOS2WIN and it worked fine. If you try the above 2 steps and still crash PLEASE email me so I can fix it!

Finally, I would like to make a German version. It seems everyone always writes stuff in German and it has to be translated to English. Well, I want to do the reverse. Anyone want to help me? If you could send me a translation of the text in my program, I will give you credit in the German version...

Good luck to all in the Atari world,

Rob Meyers

Throw WERCS in the trash. :-)

Seriously WERCS is crap. I have heard that there is a new free(?) RSC editor which handles everything including colour icons. If it's not usable there is Interface which is the best I have ever seen. Not perfect but defenitly the best you can get.

If you must use WERCS I guess you have to design your resource files using TOS. :-\

and many ftp servers and BBSs. Yes, it's MagiC proof, and I agree, it's
quite good. It's only fault is that it insists in using it's own routines
to display the resource trees, and those routines never heard of the 3D
attributes :-(

Magic 5 doesn't seem to be providing the AES >=3.3 functionality for menu_popup(). The AES verison = 3.99, and the call to menu_popup() returns a zero (0).

I have heard from NEWSie users that the popups did appear under Magic, but I cannot see them.

Is there a Magic configuration variable I can set to support AES >=3.3 features like menu_popup()?

I got the second idea from you - you sent me the SCANFONT file and code before.
It works OK except not so well under plain GDOS at times, say with a Timeworks setup. The screen fonts are OK but the TW fonts aren't listed on some systems (or some TW version fonts?). It's weird.

I've since tried using work_out[10] which gives the number of screen fonts to start with, which works a *little* better under more circumstances:

```
    screenfonts = work_out[10];
loadedfonts = vst_load_fonts(handle, 0);
totalfonts = loadedfonts + screenfonts;

printf("Screen fonts available: %u\n", screenfonts);
printf("Loaded fonts available: %u\n", loadedfonts);
printf("Total fonts available:  %u\n", totalfonts);
```

```
for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_f_name(handle, i, fontname, &type);
fontname[31] = '\0'; fontname[strlen(fontname)] = '\0';
printf("%-3u  %-5u  %d %s  %s\n", i, font_id, type,
(type == 1) ? "Outline" : "Bitmap ", fontname);
}
```

ST+ Diskmagazine, The only Monthly ATARI publication, and currently enjoying its second successful year :)

Ever felt the urge to write an Article? or maybe you have some software that you think is brilliant and want to tell everyone about it? well here is your chance,

Maybe you want to FREEly advertise or promote something ATARI related that you are involved with,

ST+ Is mostly an "off line" production with a targeted audience of people who do not have access to the Internet, so maybe you want to send them a message, tell them something or make them aware of something?

ST+ is always pleased to receive anything that anyone writes!, so long as it is in good taste, not offensive or illegal, then it will get used,

ST+ is more than likely about to go to TWO disks per month, this is to accommodate 256 colour graphics and other essential diskzine files, NOT for PD or useless programs you already have :) but for extra articles and graphics,

So there will be room for just about anything you want to submit,

ST+ are especially on the look out for anyone who wants to take on a regular, more permanent role, the diskzine is cut into sections, with each section having there own editor, so maybe you know enough on a subject to write every month and have your own little corner,

Whatever you want to write, then simply send it in and it will be used, this is your chance to get your views/ideas and thoughts across to not only the on line community, but also the majority of ATARI users who do not have the Internet,

ST+ is distributed world wide, check out the ST+ web pages for

more information,

Don't forget! you do not need to contribute, you can still enjoy ST+ by just reading it..we don't mind :)

All Feedback, Submissions to : diskzine@earthling.net

JMR>Magic 5 doesn't seem to be providing the AES >=3.3 functionality for
JMR>menu_popup().

It does. You just have to install XMEN_MGR that comes with MagiC.

bye, Thomas

Regi$ter Online! has implemented a terrific new type of "software" concept called, "Design-YOURware."

"Design-YOURware" is a unique programming proposal and creativity tool for software users and software developers alike.

Using "Design-YOURware," a software user may design his or her software anyway desired while submitting several personal choices to a programmer, who will in turn consider developing the user's "creation" upon a private Work-For-Hire Contract between user and developer.

Software developers may use "Design-YOURware" as a creativity tool, reviewing all options for creating unique programs. In particular, software developers may especially enjoy using what we have named, "What the @#$!?"

This tool (What the @%$!?) is a random idea developer, spitting out random concepts unique to the developing environment geared to jar new ideas. All credit for this random idea developer goes to Javascript editor Don.

You may experience this new concept, "Design-YOURware," at www.registerline.com

All comments, criticisms, and questions are welcome.

Thank you
Patrick Miller

SORRY !

Wrong newsgroup ! I thought I was in a german newsgroup ! Sorry guys ...

English version follows ...

Hi,

we recently released the RUNNING Shareware. You can find the official
mail of the Running mailinlist below. As I am not familar with the topic
newsgroups
I would be happy if someone would distribute this message to other Atari
newsgroups.

Thanks in advance

Mike of STAX.
michael.opel@sap-ag.de

************ RUNNING NEWS **********
* A Doom style game for ATARI Falcon computers *

Sorry for the delay, but we had big trouble with
our mailinglist account.

****

On 14th of April RDT released the

RUNNING SHAREWARE EDITION.

You can download the files (Runshar1.zip, Runshar2.zip)
from our homepage at:

http://stio1.fh-wuerzburg.de/student/i381

Size at all: 1700kb.

Other sites: * ftp.uni-kl.de
* ftp.uni-regensburg.de
* ...

****

This version contains the first episode. It's full playable !
So there are different enemies, weapons, secret rooms and
some other specials. Of course we don't show everything -
You will get the other stuff in the following epsiodes.
Please read the README and HOWTO included in the zip files for
detailed information. Check it out !

Feedback:

Send us your opinion, critics and maybe problem reports, please !

Development information:

We are finishing the next two episodes at the moment. Expect five
episodes in the final version. We hope to get the final
version shipping soon (yes, I tell you this again and again ...).

Ordering:

Please DON'T order the game now ! Please wait for the FINAL
RELEASE ! Everyone in the mailinglist will get the release
acknowledgement right after the release - additionally one week
before it a advance release note (for ordering ...) ! SO DON'T
PANIC !

Your RDT team.

Hi!

In article <E8y30w.Ctn@cix.compulink.co.uk>,
msbaines@cix.compulink.co.uk ("Mark Baines") writes:
> For the next version of PROFILE 2, I'm scanning the U: 'drive' and reporting
> on the Dpathconf() values returned for each drive and filesystem.
Well, I don't know PROFILE 2, but wouldn't it be better to check the Dpathconf()-values for the affected directories? Remember that symbolic links within a drive may point to a completely different filesystem. For the same reason, use Dpathconf() with "\." at the end of the requested path, as otherwise you'll only get information about the filesystem the requested symbolic link to a directory lies in. I.e. in MagiC, using Dpathconf("U:\a", mode) will supply information on path U:\, whereas Dpathconf("U:\a\.", mode) will follow the symbolic link and report on U:\a\.

> However, it gets to a CDROM and it doesn't like it, sometimes crashing under
> MagiC 5.
Which CD-ROM driver is used? The XFS from Steffen Engel together with his SCSI driver? Actually, there shouldn't be any problems in calling Dpathconf() on CD-ROMs, but I was told that Thing sometimes crashes when reading directories with Steffen's XFS. So far, I don't know why this happens, but as Thing has never had such problems with other drives and drivers, I suspect the problem is located in the XFS or the kernel.

> This drive isn't listed under pun_info and it also fails a
> _mediach() check which I perform before getting BPB details which is what I'd
> expect and normal.
Sure.

> What I need is a way to skip such drives. I thought of Dopendir on U:\M\.
> Would that fail on a CDROM? Ideas welcome.
Dopendir() may or may not work on CD-ROMs. Some MetaDOS-drivers even offer for these calls for the CD-ROMs under SingleTOS. That means, Dopendir() may return -32L for CD-ROMs, a valid handle or an error code (if no CD-ROM is inserted). There's no way to use Dopendir() to distinguish between different media types.

Ciao

Thomas

     rojewski@primenet.com (John M Rojewski) writes:
> Is there a Magic configuration variable I can set to support AES >=3.3
> features like menu_popup()?
No. If you want to use the extend menu features with MagiC, you have to
run the little TSR xmen_mgr.prg first (it's installed as one of the
utilites in the \gemsys\-directory). Andreas Kromke decided to leave
these functions out of the main kernel, because he thinks too little
programs actually use them ...

And btw., if possible, always use appl_getinfo() to check whether certain
features are supported by the current AES, and not only the version number.

Ciao

Why on earth did he think that? It's almost harder to find a program
that doesn't use them these days then find one that does. :-)

hi,

sorry if this question has come up before, but i don't read comp.sys.atari
very frequently.

i'm in the need of a complete documentation (preferably online) for
the atari os. i have an old book "atari-st profibuch" that covers everything
up to tos 1.4. now i'm writing an alternative operating system (oberon) that i
want to be able to run on any atari i can think of. unfortunately, the
system relies on some tos system-variables and changes some system vectors.
because of this i'd be glad to have documentation on "newer" tos developments,
to ensure compatibility.

thanx for any hints,

simi

Perhaps you can try something like (not real C code :-)):

```
     draw_frame( starting_pos, mouse_pos);
     old_mouse_pos = mouse_pos;
     while( mouse_keypressed ) {
       graf_mkstate( &mouse_pos, &mouse_keypressed);
       if( old_mouse_pos != new_mouse_pos ) {
          vwrs_mode( vdihandle, MD_TRANS);
          draw_frame( starting_pos, old_mouse_pos); /* clear old frame */
             vwrs_mode( vdihandle, MD_REPLACE);
             draw_frame( starting_pos, new_mouse_pos); /* draw new frame */
             old_mouse_pos = new_mouse_pos;
```

```
        }
        /*
          other real-time treatment ...
         */
     }

     draw_frame should draw a frame using standart VDI call
```

RTFM ! Popup functionality is put into external modules, since few programs use it. The MagiC distribution has an executable that must go into the auto-start folder, only then MagiC does popups.

Cheers Peter

X-Deja-AN: 236973063
Organization: Global Datalink, Inc.
Newsgroups: comp.sys.atari.programmer

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY
MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the
headline of your letter. Unlike TV, magazines, newspaper ads, and
direct mail where more than 99.99% of the recipients will skip right
over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate well over 100 MILLION people will have E-mail accounts in the next year! E-Mail Blaster turns your computer into a cash register by giving you FREE, immediate access to all of them. Do you think some of the more than 100 million people with E-mail addresses would be interested in your products or services? Even if you don't have your own products or services you can still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
  Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4 days instead of waiting weeks or months like with television or print advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out millions of letters using the United States Postal Service! Now you can send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new technology and the most advanced bulk E-mail software on the market today. (1) E-Mail BLASTER automatically extracts E-mail addresses from America Online, CompuServe, Prodigy, and the other online services, the Internet, web pages, news groups, and hundreds of other sources. (2) E-Mail BLASTER automatically stores the E-mail addresses in your computer along with keywords that describe hobbies and interests to created highly targeted E-mail addresses. (3) E-Mail BLASTER sends your marketing letter or ad to MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor
for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there

is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future
customers. We know we need you to make our software business a true success!

(Please if our lists are incorrect put "remove" in the subject and just hit "REPLY" and you will not be bothered again. Please forgive our mistake).
****
To take advantage of this opportunity, please fill out the order form below and fax to
1-407-380-3545. Don't miss out on this opportunity! Sales Rep: (Nejeh Yusuf @ 407 380 3545)

RTFM! A few? :-))) Pick 10 apps made in the last two years, how many
of them use popups? 9? :-)

It's not a big deal now when we can use them under MagiC anyway, but I
wouldn't say that "few" program uses them. Most does.

       ^^^^^^^^^ ????????

Well I am a little fed up of reading so often definitive opinions about products.
Reasonably, there are in most cases pros and cons in this matter.

I have been using WERCS for years, and I have developed dozens of resources with
it, with no problem. Is that such a crap?
OK, I run a MegaSTE, so I don't know about color icons.
For WERCS vs MAGIC, whose fault is it? HiSoft used to have excellent developpers
and to produce cleanly programmed utilities.

I am not setting up a debate. I just wanted to say: "Please don't fire so easily on commercial products that are respectable in many aspects, because they are not so many".

Cheers.

Sorry, but I can't say that I like Wercs. Okey it was good when it was
released in 98 or something but if you want ot do some fun stuff you
realy need a better resource editor. For regular resource files using
mono it's okey but not if you have got colour and wants to do some
more advanced stuff.

> I have been using WERCS for years, and I have developed dozens of resources with
> it, with no problem. Is that such a crap?

Maybe it's wrong of me to say that it's crap, but it's very outdated
and can't do what the "new" can do. It doesn't realy support AES above
3.3 with 3D objects, colour and colour icons.

> OK, I run a MegaSTE, so I don't know about color icons.

Yup and if you use it for pre Falcon programs it's fine.

> For WERCS vs MAGIC, whose fault is it? HiSoft used to have excellent developpers
> and to produce cleanly programmed utilities.

They do? The compilers are fine but the tools to use them with isn't
exactly that cool. I realy can't stand the editor supplied with
Lattice, but I wouldn't either want to live without the integrated
developing enviorment which it supplies. :-\

> I am not setting up a debate. I just wanted to say: "Please don't fire so easily
> on commercial products that are respectable in many aspects, because they are

> so many".

I see what I you mean but I agree with you 100%, but Wercs is old and
ther are much better programs to do the job for you.

I would like to inform you that KP SACK 1.0 - SAA Construction Kit -
is now available for download either from various FTP sites, or from
the Kosmik Phish homepage at:
   http://www.cs.man.ac.uk/~jacquesa/kpp/

For those who are not aware of what an SAA file is, it is a way of
creating new events which sounds can be assigned to via SAM. KP SACK
provides a simple interface for creating SAA files and makes it as
easy as possible to make use of them within your own software. To
make full use of SAA files, you will need SAM 1.3...

SAM 1.3 is an (officially sanctioned) bugfixed version of Atari's
System Audio Manager, which allows the user of an Atari system with
DMA sound and TOS 2.xx or greater to assign sample sounds to system
events such as window manipulation.

For more information on either of these programs, either visit our
WWW pages at the above address, or read Atari Computing.

Dominique Bereziat (bereziat@ozone.inria.fr) wrote:

```
:    draw_frame( starting_pos, mouse_pos);
```

Yep. (Use v_pline) But draw in XOR.

```
:    old_mouse_pos = mouse_pos;
:    while( mouse_keypressed ) {
:      graf_mkstate( &mouse_pos, &mouse_keypressed);
:      if( old_mouse_pos != new_mouse_pos ) {

:         vwrs_mode( vdihandle, MD_TRANS);
:         draw_frame( starting_pos, old_mouse_pos); /* clear old frame */
:            vwrs_mode( vdihandle, MD_REPLACE);
:            draw_frame( starting_pos, new_mouse_pos); /* draw new frame */
```

Again, you'd better use XOR mode to draw. This way you can easily remove the old rectangle (2 times inverted -> original background) and draw a new one which shows what's beneath it...

Hi, its me again.

trying shel_write(1, 1, 1, prog, tail) in Magic 5, but the prog will
not start until AFTER the calling program has ended! I tried (1,1,0,
etc, but no luck.

Then I tried pid=Pexec(100, prog, tail, NULL); It works ok, but the
call to Pwaitpid(pid, 3, NULL) returns -32 as the return code, which
I think is 'Invalid Function'. pid seems to be positive integer as
stated in docs.

Help,
John

>not start until AFTER the calling program has ended! I tried (1,1,0,
>etc, but no luck.
Shelwrite work well under Magic 5, without my documentation I don't know
how it work it something like shel_write(100,....), I 'll look for it.

>Then I tried pid=Pexec(100, prog, tail, NULL); It works ok, but the
>call to Pwaitpid(pid, 3, NULL) returns -32 as the return code, which
>I think is 'Invalid Function'. pid seems to be positive integer as
>stated in docs.
Pexec(100,...) don't work under Magic 5 you should use shel_write()

bye

hi

Could anyone point me towards those programs that translate, for example German->English usually used for PD documents?? I would also be really interested in the source code.

Davy

The best of the lot is Ruftrade2. Pay the $10.00 shareware fee. That version works even better than the demo. The author is in UK.

There are a number of other programs available. Look in the misc. or text (doc, info, etc.) directories. There is one that allows you to edit the dictionary yourself. Some have source.

I have most of them. Contact me via email for more info.

Later,

George

Hi John

MagiC5 shel_write values are different from AES4 etc. Typical isn't it!
In my programs I cater for singletos (and use Pexec), MultiTos (shelwrite)
and MagiC (shel_write). It's a pain but there's no other way AFAIK.

Here's an example of code that does launch programs concurrently with the
calling app (without the calling program having to end).

```
*maxapps retrieved from appl_init etc.
       cmp.w    #1,max_apps
       bgt.s    .multi

*singletos, won't run until calling app ends
Pexec .singletos
       Pexec  #0,env_ptr,#com,#env
       Pterm0

*magic_version, is retrieved from the MagiC cookie etc.
*Basically execute this version of shel_write if MagX found.
.multi
       cmp.b    #$01,magic_version
       blo.s    .multitos
       Shel_write #1,#1,#100,env_ptr,#com
       bra.s    .donerun

*otherwise assume it's MultiTOS
.multitos
       Shel_write #0,#1,#0,env_ptr,#com
```

Explanation of Shel_write()

shel_write(mode,flag_gem,thread,exec,tail)

under multitasking system:

mode = 1 -> Launchnow (theres some bits for environment, memory allocate for prg but they are optionals, tail depends of them but without it's normal a tail)

flag_gem = 1 for GEM program or 0 for TOS program (under Magic it launch VT52.PRG witch start your program)

thread = 100 : start in parallel mode
         101 : start in single mode
..

I prefer alway's start a program in parallel mode and if I want a single
mode I wait for the end of the program by evnt_messag()
If I'm under monotasking system I prefer use Pexec().

I think it's enought to answer to your question.

THE system analyser for all Ataris and OSes. Current version 2.14 but 2.20
is out RSN and incorporates more reporting and better compatibility.

Try HENSA via ftp, telnet, gopher at micros.hensa.ac.uk
    /micros/atari/tos/p/p143 directory

There might be older versions at because they are such a problem logging into!

Paderborn in Germany via ftp.uni-paderborn.de
    /atari/tools/util directory.

University of Michigan in the US via ftp atari.archive.umich.edu
    /Utilities/Benchmark directory.

Imperial College mirror sites via ftp src.doc.ic.ac.uk
    /packages/atari/umich/
    /packages/atari/uni-paderborn directories.

File is called PROF2_14.ZIP.

>For the same reason, use Dpathconf() with "\." at the end
Yep, I do.

>Which CD-ROM driver is used?
ExtendOS I think, It's not my system but a beta tester's.

>Dopendir() may or may not work on CD-ROMs.
Having subsequently done a test I know do a Dopendir() for each path before requesting each of the Dpathconf() values and it does indeed fail on the CD-ROM as I'd hoped.
Another problem bites the dust!

Thanks Thomas.

Is there a rule as to how many scratch registers are available, or are
used by TOS?

In general, I know I can count on D0-D1 and A0-A1 being corrupted by an OS call, but how about D2+ and A2+, or, for that matter, FPU registers?

The reason I ask is that I have patched into the XBIOS vector to provide an XBIOS interface to my Toolbox DLL engine, and having used the first two data and address registers as scratch registers, I need to know if more registers are deemed scratch and therefore need to be saved by my code.

I think you have to separate the test, one for Atari ST tos and
one for Atari STE tos. What worked good with tos 1.0 and 1.02 (ST)
did not work good with tos 1.4 and 1.6 (STE) and opposite.

As you may be aware, I have been readying my Toolbox DLL engine for later public release.

(I still haven't finalised the nomenclature for the "DLLs". What would you prefer to call them? ie Plug-ins? [Toolbox] Extensions? Libraries?)

In the past, all extensions have been written in assembly language. However, as coding in 68000 assembly language appears (unfortunately) to be a dying art, I have modified things slightly and extensions may now be written in C.

The following example extension (written in Lattice C) should shed some light upon writing an extension. For those of you who have followed a thread similar to this a month or so ago, this is a C version of the assembly language example posted with that thread. Compiled under Lattice 5.60, it comes out to 40+ bytes larger in memory usage, for no real increase in functionality.

All externally callable functions are __stdargs (Stack passing).

__saveds may be applied to some funcs if you use base relative data.

I will post the "te.h" header that this sample code needs shortly.

This extension was compiled under Lattice C 5.60, with 32 bit ints, for a 68000 with no floating point and no debug info, generating near code and near data, and passed without errors or warnings. (I'd set the "ignore C++ comments" flag/option, however)

(BTW: I assume you are all prescient enough to understand what the type "uint32" refers to)

-- Begin sample code

```
// TE.C
// Sample Toolbox extension in C
//
// 27-Apr-1997
//
// (C) Copyright 1997
//     G. Miller
//     Auckland
//     New Zealand

#include "0/te.h"   // contains prototypes used in this extension
#include "0/types.h"   // contains definitions of "uint32" and so forth

// this is version 0.01.00 of the extension
#define VERSION    0x00100
```

```
// this is correct as of 27 April 1997
#define DATE 0x19970427

// CURRENT_TOOLBOX_VER is defined in te.h and is 0x012065 (v1.20.65) at
// this point in time. This value will change over time, however, so you
// are advised to use the define from the include file rather than hard
// coding this value in your source
#define MIN_TLBX CURRENT_TOOLBOX_VER

// forward declaration required in ExtensionInfoBlock
extern FunctionTable ft[];

// prototypes for sample API calls within extension
__stdargs uint32 _teOne( void );
__stdargs uint32 _tePassed( uint32 );
__stdargs __saveds void   _teStore( uint32 );
__stdargs __saveds uint32 _teRetrieve( void );

// this structure _must_ be first (offset zero) in the initialised data
//   segment
// It will be examined by the Toolbox prior to loading it, so all
//   elements within this structure _must_ be initialised at compile time.
// __far places it in "Far data" at beginning of data seg, as opposed to
//   "near" data which is at the end of the initialised data segment
ExtensionInfoBlock __far eib =  {
     // the first 64 bytes identify this as an extension
     // and give some info about itself
     'tb16',       // magic number. REQUIRED
     '_TE_',       // library identifier "cookie".  REQUIRED
     0x00FFFF,// library number. MUST = 0x00FFFF. REQUIRED
     VERSION, // version number
     DATE,         // date
     sizeof( ExtensionInfoBlock ),    // size of this info block. REQ
     "TE_example", // Textual label. 10 chars + NULL. Required
     0,       // alignment byte. Must be zero
     0,       // Reserved. Must be zero
     "",      // Padding to 64 byte boundary

     // the next 64 bytes declare what this extension requires
     MIN_TLBX,// minimum toolbox version needed
     0,       // reserved. Must be zero
     68000,        // CPU required
     0,       // FPU required (if any)
     0,       // reserved (must be zero)
     0,       // reserved (must be zero)
     0,       // extension flags (should move to prev block)
     0x0100,       // TOS version needed
     0x01,         // TOS Flags : 01 = EQ, 02 = GT
     "",      // padding to 64 byte boundary

     // the next 64 bytes have pointers to needed data
     ft,      // function table   REQUIRED
     teExit,       // called when extension is being unloaded
```

```
    "",      // padding to 64 byte boundary

    // the fourth 64 bytes have no higher purpose at the moment
    // but the first two entries are REQUIRED
    'tb16',       // magic number  REQUIRED
    '_TE_',       // library identifier "cookie". REQUIRED
    ""       // padding to 64 byte boundary
};

// ftr _must_ be IMMEDIATELY before ft in memory. The members of this
// three element array are :
// 1) Number of functions in ft table
// 2) Lowest function number in table
// 3) Highest function in table
// this can (and probably will) be overwritten with the correct values
// when the extension is loaded
uint32 ftr[] = { 4, 0x0100, 0x0103 };

// The function numbers in the ft array _must_ be in ascending order
// The very last entry is "0x10000" to signify "end of table", and should
//   point to a dummy "do nothing" function, or NULL
// The high word of the function numbers will be modified on loading
//   to reflect the library number assigned to this extension
// Function numbers should begin with number 0x100, as function numbers
//   below this are "about this lib", which have been obsoleted by the
//   tlbxLibInfo call introduced about a year ago
FunctionTable ft[] = {
    { 0x000100, _teOne },
    { 0x000101, _tePassed },
    { 0x000102, _teStore },
    { 0x000103, _teRetrieve },
    { 0x010000, 0L }
};

// used by dummy API calls
uint32 saved;

// teInit is called when extension is loaded for the first time.
// Any initialisation the extension must do should be done here.
// It should return either a pointer to the info block or NULL.
// It _must_ be located at the start (offset zero) of the code segment
__stdargs ExtensionInfoBlock *teInit( ExtensionParameter *ep )
{
    return &eib;
}

// teExit is called when extension is being unloaded
// This is a good place to put any clean-up code (freeing up any RAM
// the extension may have Malloc'd, for example)
// It will only be called if the ll_unload pointer in the info block
// is non-zero.
// This function is optional, and may be omitted if it isn't needed
```

```
__stdargs void teExit( void )
{

}

// some sample API calls
// return 1
__stdargs uint32 _teOne( void )
{
    return 1;
}

// return the passed parameter
__stdargs uint32 _tePassed( uint32 val )
{
    return val;
}

// store the passed parameter
__stdargs __saveds void _teStore( uint32 val )
{
    saved = val;
}

// return the stored value
__stdargs __saveds uint32 _teRetrieve( void )
{
    return saved;
}
```

-- End sample code, begin signature block

Thanks to spambots (and the address collector bots that feed them) that cause my inbox to be filled [75 to 80%] with MMF/pyramid schemes, US-only telco ads [even though I am obviously not a US resident], and other associated crap, and as I must pay for my data (email, webbing and so forth), any email sent to address gmiller@inca.co.nz will bounce. I would like to apologise to the genuine respondents that this may inconvenience.

Unfortunately, that approach won't work. Ultimately, you will need lots of Beta testers with different platforms (or pick up a lot of

different STs sans monitors cheap).

g > available, or are used by TOS?

According to the Atari Gemdos reference manual, D0-D2 and A0-A2 may
be modified by Gemdos calls, while D3-D7 and A3-A7 will always be
preserved. AFAIK, no Gemdos function uses the FP registers at all.

Use 100 (MagiC parallel) or (101 MagiC single) for the third parameter.
It's all in the MagiC development documentation.

> Then I tried pid=Pexec(100, prog, tail, NULL); It works ok, but the

It obviously means the function doesn't exist yet in MagiC ! Haven't you
read the MagiC developers docs ? But the shel_write way is the better way
to parallel start GEM programs.

Cheers Peter

The buggiest TOS is normally considered TOS 1.0, with little distance
ahead of TOS 1.2. But note your approach doesn't replace real testing on
other OS versions, as those do not simply have less bugs, but also
different bugs, which might break your code after it survived everything
in TOS 1.0.

Cheers Peter

Atari stuff for sale as follows :-

If the prices appear with a funny character in front of them, they
should be UK pounds :)

HARDWARE
========

Atari 1040 STe (upgraded to 4MB) 75 - see @@@ below
(includes Quickshot joystick,
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Atari mouse, cables - TV and power)

Atari 520 STfm (upgraded to 2.5MB) £15
(BROKEN - wont boot correctly,
but may be suitable for repair or
for breaking for spares)

Gasteiner 42MB hard drive (DMA) £45 - see *** below
(includes leads + utility software)

Philips CM8833 MkII colour monitor £60
(suitable for ST low and medium
includes ST <-> monitor lead)

All of the above come with manuals, except broken STfm.
All in mint condition.

For the above kit, email me (bottom of list) to discuss P&P / delivery.

For the stuff below, P&P (1st class recorded delivery) included, where possible. If you want registered, we can discuss that.

SOFTWARE / BOOKS
==========

Games
=====

F-19 Stealth Fighter £8

Midwinter (strategic 3D game) £7

Maniac Mansion (funny / scary graphical adventure) £7

Future Wars (graphical adventure) £7

Interphase (excellent 3D graphics) £5

Germ Crazy (halt the invading bugs!) £7

Time (graphical adventure) £7

F-16 Combat Pilot £5

Starglider 2 £5

Substation (Doom-like game) £10
STe only (maybe Falcon too ?)

Obsession (v. good pinball game - best £10
graphics I've ever seen on my STe)
STe only (maybe Falcon too?)

Programming

Personal Pascal v2.05 £12
Actually an STF cover disk, but
I ordered the manual from HiSoft
for £20 and that's what's for sale
Cover disk included

Lattice C v5.52 £30
Excellent for learning / using C
Full development environment (incs
WERCS and many other tools)
More manuals than you can carry (almost) :)

HiSoft 'Your FirST Basic' Manual/disk £3
Well worn but useful :)

The Atari Compendium book £20
Errata included in the book in my
own fair hand. Everything you
wanted to know about Atari 'C'
/ programming

Misc

Timeworks V2 - ST DTP £15
boxed with manuals

Chemkit (chemical structures drawing £10
package - hi res or hi res
emulator required - I'll include a
PD one that I used. Manual included)

PFM Plus - personal finance manager £7
excellent software - incs manual

1st Word Plus (word processing package) £10
good / basic WP with manual

3D-Calc (3 dimensional spreadsheet) £7
boxed with manual

*** Magic v2 £15
Fully pre-emptive multitasking OS
manual included

*** Ease v3.01 £15
Excellent new desktop for your ST -
works a TREAT with Magic :)
manual included

***   I'll bundle these with the hard drive for £20

@@@   I'll include my entire collection of old magazine cover disks
      with the STe - I'm not going to count them but there are a LOT.
      Covers STF (lots), ST Review (dozen or so), a couple from a
      couple of other mags. Also the first 3 Atari Computing mags
      with cover disks. You can continue this one yourself :)

   The entire set of Atari World (issues 1 -> 11) inc cover disks. £25
   I won't split these.

Contact me at :-

 drew@thegibsons.demon.co.uk (preferred)

 Or at my point off STandard ProBBS on :-

 It is obvious. My brother(Australia) has Netscape and freeware programm
 "Cooltalk". On Falcon hardware should be easy to make an prg to take
 sound from microphone input and send it through internet.
 Next decoding incoming voicedata and send to the speakers.
 All must be fast enough for 28800 modem users. Using slip connection.
 This make money saving in long distance calls (eg.Europe-Australia)....

 with best greetings
 Andy

I have a Mega STe mother-board, i have questions please
answer me, because i want take advantage of the board..

what type of HDD's for Mega STe can i use? internal,
external,removable-media..
what type.? : need special connector? (prices)
Exist IDE adapter for Mega STe?

Can I connect a ET4000 with Crazy Dot to Mega STe??
how cost Crazy Dot ?
how cost ET4000 ?

what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
what monitor? with some special connector?
Is Nova Graphics card a good choice?

exist differents types of cases for Mega STe..??
what type desktop? tower? (prices) ..what case i need if a want connect
ET4000 & Crazy Dot to Mega STe Motherboard??

what languages & kits exists for Mega STe to programming??(prices)
(like C++,C,java,perl,databases..)

I know that megaste motherboard came with TOS 2.05..then the question
is ...which are the differences between it and TOS 2.6.???

I hear that megaste have keyboard input..... what type of keyboard
....an "atari-keyboard" or "PC-keyboard"?? (what is the cost of each)

Can I up the speed of Mste ??? (16Mhz to 32Mhz)

Thanks very much to anyone that answer my questions. Good Bye Friend./

PS: Sorry for my english./

Look at the subject: Internet telephone. The guy then asks if anybody is coding
the subject for the Falcon. Seems pretty obvious to me ;-) He's clearly not one to
use two words when one will suffice, a bandwidth conservationist...

Yes. AtarIRC 0.71 has provisions for plug-ins, currently a doodle

sketchpad, but a Netphone is being developped by a friend, mainly
for Falcon DSP, but also with playback capabilities on STE/TT. In
the future, sampling cards like the Replay 16 could be supported,
to allow voice input on STE/TT as well. No idea on release date.

I agree,

However, I like to torture test my code before it goes out to my beta
testers. I can often learn a lot more about when/where/why it crashes by
observing it myself than relying on the beta testers I have.

Yeah that's cool. The problem with apps like this is that you want it
done you better dig out a DSP book and a programming language and
start programming! Many will love you for doing it but if you have got
an idea you better try to do it your self. Okey most ideas are not
very easy to acomplish, but most actually are.

For C I would recommend Lattice C 5.6, which is very complete and documented in
english. Price is about $200, but it may vary.

Sorry , no.
It is documented that D0-D2/A0-A2 can be corrupted by a BIOS/XBIOS call.

Indeed, a desassembly of a TOS 2.05 BIOS/XBIOS entry points shows that:
 - BIOS and XBIOS share the same code. BIOS loads the address of its own routine jump table, so does XBIOS.
 - Next, in the same piece of code, registers D3-D7/A3-A7 (yes, A7!) are saved in a special area (not on the stack, but this is another story...).
 - Finally, via the loaded address table, control jumps to the appropriate subroutine.
(Of course, in the above description, I have skipped some details.)

So, registers D2 and A2 must be saved by your routine before a BIOS/XBIOS call.

Regards.

How are you running X-Windows on a 68000 ST? You need at least a 68030 to
run Linux/UNIX which is X-Windows' OS. Don't tell me you're using Minix?!?!

Showing my age here. At the time, a few megabytes was really really

HUGE!

p > Ask this person where DEC's GUIs are nowadays, ask him where
p > Ultrix has gone. X however is still very much alive. This
p > should tell which GUI had the better design.

So, are you saying that MS-DOS and Windows are successful because
they are better designed than the competitors?

As I said, I've used lots of different OSes, and almost all of them
were better designed than UNIX (but more expensive and available on
only one platform each).

Go with time. There is no really modern GUI anymore that won't need more than a megabyte.

You're right considering the time X was developed. But the fact it still competes well with every other modern GUI tells us we shouldn't call it just huge for the memory standards at that time, but sophisticated and far ahead of it's time.

No, occasionly the worse systems prevail, in this case by acceptance by the masses. This does not apply to X.

> As I said, I've used lots of different OSes, and almost all of them

You mean they were user-friendlier to the novice. In that respect you're certainly right, but that should not be mixed with real qualities, most notably flexibility and portability.

Cheers Peter

Note that X is portable enough to not require Unix to run on. In fact
there is a well functioning port to MiNT. As I said, a 68000 is a little
to small in terms of CPU power, so it's slow, but it works ! And I saw it
work really well (under MiNT !) with the power of a 68030 !

I've heard X Windows called a lot of things, but "sophisticated" is
not one of them. Ahead of its time? If so, things do not bode well
for the future.

Woodrow Wilson was also ahead of his time. He was a bigotted
imperialist with a horrible civil rights record, and he was 20 years
before Hitler!

```
server:   What is your Display?
client:   display = XOpenDisplay("unix:0");
server:   What is your Colormap?
client:   cmap = DefaultColormap(display,
```

```
                              DefaultScreen(display));
server:   And what is your favorite color?
client:   favorite_color = 0;   /* black */

          /* No, I mean: */

          favorite_color = BlackPixel(display,
                              DefaultScreen(display));
```

client falls into chasm and dumps core. -- The UNIX-Haters Handbook

Actually, my first X Windows manual used 3 pages of code in order to open a window in the section on "Getting Started".

Hi!

In article <dwilga-1703971024240001@dwilga.comm.mtholyoke.edu>,
     dwilga@mtholyoke.edu (Dan Wilga) writes:
> That's right, always use the a7 test. It works under Geneva, MTOS, MagiC
> and, of course, old-TOS.
Erm, the only way to check for being an accessory that was ever documented by Atari is to check a0, not a7. For programs, it's zero, for accessories, it points to its basepage.

> IIRC, there may not even be any way

> to truly launch a desk accessory AS a desk accessory from MagiC after
> startup. But I haven't seen later versions of MagiC so I could be wrong
> here.
MagiC >= 4 is able to launch accessories via shel_write() mode 3, but it's not possible to check for that via appl_getinfo(). That's bad, but the way to check for supported shel_write()-modes offered by appl_getinfo() is quite useless, to be honest.

> On the other hand, both Geneva and MTOS use the GEMACC env var in GEM.CNF
> to determine which extensions are treated as DA's. Anything matching the
> extensions is launched as a true DA with the correct (zero) a7.
It would be nice if Geneva would respect the wishes of the programmer when using shel_write() mode 1. Even if shel_write() gets told that the program which is to be launched is a TOS program, it runs it as an application, i.e. the TOSRUN-manager is not used. Only mode 0 behaves correctly by looking at the program's extension, but that's not always accetable, for example if you want to start Unix-tools which usually don't have any extension at all.

Ciao

Thomas

Hi everybody,
   Does anybody have any ideas about making a rubberbox (just like
graf_rubberbox of aes), but instead of waiting for the call to complete
in order to do other thing, one could have instant access to the current
co-ordinates, and thus, be able to update w,h in real time?

Also, how is the graf_rubberbox implemented in AES? Does anybody know
how to make custom ones?

Thanks,
Nima

THIS ABSOLUTLY IS THE FAIREST AND MOST HONEST WAY TO SHARE WEALTH!!

HELLO!!

Would you like to make thousands of dollars, quick and legally? Than take
5 minutes to read this article, it's going to change our life! What is 5 minutes of the life that you now have. Are you just snoozing,doing the same
old thing? YOU WANT CONTROL OF YOUR LIFE OR GET BACK THE CONTROL YOU ONCE HAD? YOU WANT FINANCIAL FREEDOM????????

THAN YOU SHOULD ABSOLUTLY READ ARTICLE!!! IT'S TRUE!!

You can make up to or over $50,000.00 in 4 to 6 weeks, maybe sooner! Keep reading if you want to take control of your life, if not, than have a great day.

One day I was browsing thru the newsgroups and read an article like this one. Since it that to do with making money, I was courious and decided to give it a try, and this is what it said:
Here we go.

A little while back, I was browsing through these newsgroups, just like you
are now and came across an article similar to this one that said you could
make thousands of dollars in just weeks, with only an initial investment of
$5.00!
So, I thought, "Yeah, right,it's got to be a scam", but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and addresses stated in the article. You then place
your own name and address in the article at the bottom of the list at #5,
and post the article in at least 200 newsgroups (there are over 22,00). So after thinking about it, and talking to my wife about it, who said I was nuts!, what does she know, I'am nuts anyway, I figured what else was I doing, and it's only 5 stamps and $5.00, right? Someone who has tried it says:

"I started receiving money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept

coming in, tripling in size and multipying by 10 -20 times the amount that I got the first week! In my first week I had made about 30 -40 dollars.
But by the second week, I had made a total of over $1,000.00!!!!!
In the third week, I had over $10,000.00, and it's still growing.
This is my fourth week and I've made about $42,000.00 TOTAL, and the money is still coming in.....". Let me tell how this works and most importantly, why it works.....also make sure you print a copy of the article NOW, so you get the information off of it, and begin making money.
The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 6 seperate pieces of paper and write the following on each sheet of paper.....

" PLEASE PUT ME ON YOUR MAILING LIST."

It is also a good idea to put on that piece of paper the number of persons
who you got the article from. Get five $1 dollar bills and place ONE inside
each piece of paper that you just wrote on,and fold each piece of paper so
the bill will not be seen in the envelope (other wise nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it.

Do the same for all 5, you should now have 5 envelopes sealed, EACH have a piece of paper and a $1 dollar bill stuffed inside of the paper. Make sure those words that were stated above are on each paper.
This is a service an 100% legal (refer to US CODE Title 18, Section 130& 1342, and Title 39, Section 3005, of the Postal and Lottery Laws).

NOW, BE SURE TO MAIL THE 5 ENVELOPES WITH THE PAPER AND $1.00 TO THE FOLLOWING 5 ADDRESSES:

1. Roland Lafontaine 2233 Jeanne Dr. Hastings Michigan 49058

2. Carl Fodor RD1 Box Y1.E.5 Weirtin W.Va 26062

3. David Zahn 65 E.Washington St No. Attleboro, MA 02760

4. Jean-Louis Pion 44 Seneca St. Cumberland, RI 02864

5. Mathea Skaalvik, Rosenborg gt 31 c, 7014 Trondheim, NORWAY

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, 3 becoming 2, ETC.)
You can slightly alter this article if you need to, editing what you need to edit.

STEP3: Post your amended article (with your name at #5) to at least

200 newsgroups. There are at least 22,000 of them). All you need is say, at least 200.

HOW TO DO THIS:

If you have Netscape 3.0 do EXACTLY the following:

1) Click on any newsgroup like normal, THEN click 'TO NEWS', which is on the far left when you're at the newsgroups page. This will bring down a WINDOW to type your message in.

2) Leave the newsgroup WINDOW like it is, CHANGE the subject box to something flashy like, "NEED CASH" $$$$ or READ HERE $$$$.

3) Tab once and you should be ready to type. Now, retype (only once)
This whole article WORD FOR WORD, except to insert your name at #5, and to remove #1 off the list.

4) When you're done typing the Whole article, click on FILE in THIS WINDOW, RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST WINDOW. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive.
DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU SAVE IT.
ONCE SAVED, move to 5 below.

5) If you still have all of your text, send or post it to this newsgroup now, by just clicking send, which is right below FILE, and right above Cc:.

6) Here's where you're going to post all 200.
OK, click on any newsgroup the click on 'TO NEWS', again in the top left corner. Leave the NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT BOX, hit the TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another WINDOW to come up.
Click on ATTACH FILE, then find YOUR file that you saved; Click once on the file, and then Click OPEN, now Click OK; if you did this right, you should see YOUR file name in the attachments box,
and it will be shaded.

****

IF YOU USE IE EXPLORER IT'S JUST AS EASY...
HOLDING DOWN THE LEFT MOUSE BUTTON HIGHTLIGHT THIS ARTICLE.
THEN PRESS THE "CRTL" KEY AND THE "C" KEY AT THE SAME TIME TO COPY THIS ARTICLE. THEN PRINT THIS ARTICLE (FOR YOUR RECORDS) TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1 BILLS TO. NEXT GO
TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE" A WINDOW WILL OPEN.

TYPE IN YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN THE
LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V" AND THE ARTICLE
WILL
BE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO
AND THEN HIGHTLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST
THE ARTICLE IN A NEWSGROUP, ALL YOU HAVE TO REPEAT "CTRL" AND
"V"
AND PRESS POST.

7) That's it. Each time you do this, all you have to do is type
in a different Newsgroup, so that way, it posts to 200 DIFFERENT
Newsgroups, you see?
Now you just have 199 to go!!
(Don't worry, each one takes about 30 sec.,once you get used to
it)
REMEMBER 200 is the MINIMUM.
The more you post the more money you will make!!!
AND THAT'S IT!!!!

THAT"S THE ONLY 3 STEPS THERE IS!!!!!!!!! You are now in the mail order business and will start receiving your $1.00 envelopes from vaious people all over the world within days!!!!!! JUST REMEMBER THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE!!!
If you wish to stay anonymous, you can come up with a name, such as"manager" or "investor". Just make sure all the addresses are CORRECT.
LET ME TELL YOU WHY THIS SYSTEM WORKS SO WELL!!!
Out of every 200 postings, let's say I ONLY receive 5 replies, which is actually very low. So I made $5.00 with my name at #4.
Now then, each person who just sent me $1.00 makes say only 200 postings,
now with your name at #4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. Now 50 people send you $1.00; that's $50.00 you just made! Now then your new 50 agents post 200 each with your name at #2,
or 10,000 POSTINGS(50x200).
Average return is 500 at $1.00 each is $500.00!!!
And finally, 5,000 people make 200 Postings each with your name at #1.
you now get a return of $50,000.00 before your name drops off the list.
And that's if everyone makes 200 Postings only, and if only 5 persons respond!!!! When your name is no longer on the list, you just take the latest posting that is appearing in the Newsgroups, and send out another $5.00 to the names on the list, putting your name at #6 again.
And start posting again. The most important thing to remember is, to realize that there are THOUSANDS OF PEOPLE FROM ALL OVER THE WORLD JOINING THE INTERNET EVERYDAY, THE EXPOSURE IS UNBELIEVABLE!!!!!
So, can YOU afford $5.00 and see if it really works? I did, and I think you can too.
TAKE CONTROL OF YOUR LIFE AND MAKE SOME REAL MONEY, THIS IS THE WAY!!!!!!
People have said, "What if the plan is played out and no one sends you the money?" So what! What are the Chances of that happening when there are MILLIONS of HONEST USERS AND HONEST PEOPLE who are joining the Internet and Newsgroups everyday and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, everyday, with THOUSANDS
of those joining the actual Internet. REMEMBER, play FAIRLY and
HONESTLY and this WILL WORK,
I PROMISE YOU!!! YOU JUST HAVE TO BE HONEST.
Make sure you print this article RIGHT NOW, also, try to keep a list
of everyone that sends you money and always keep an eye on the
newsgroups to make sure everyone is playing fairly. REMEMBER HONESTLY
IS THE BEST POLICY.
YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!!!!!
GOOD LUCK TO ALL AND PLEASE PLAY FAIRLY AND TOGETHER,
WE WILL PROSPER!!!!!!
**** By the way, if you try to decieve people by posting the messages
with your name on the list and not sending the money to the people
already on the list, you will not get much. Someone who did that
made $150.00, and that's AFTER 7 or 8 weeks!
Then he sent the 5 $1.00 bills, people added him to their lists, and in
4 to 5 weeks, he had received over $10,000.00
THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE
WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT YOUR TIME!!!!!

NOT BAD FOR FINANCIAL FREEDOM!!!!!!!
IF YOU DON'T TRY IT, YOU'LL NEVER KNOW.IT DOES GENUINIELY WORK!!!!!

Hi folks,

I've written / write a low level graphic library for RiscBSD which can
be used for writing games/demos on RBSD. The lib also includes CD-Audio
support calls to control a cdrom.

Now I'm looking for programmers which want to port it to RiscOS.
The advantage this has is that all libvidc - based programs will
compile out of the box on all supported platforms.

The main goal is to achive a maximum of speed in drawing, so some
assembler functions would be very apreciated.
Someday in the future support is planed for X-windows and/or other
windows systems.
The lib will be compatible to SVGAlib (Linux/i386) and later to
srgp.

PS: programmer who want to port it to the Amiga, Atari Falcon030, Mac, DOS or
anywhere else are wanted too.

The lib will be BSD-licenced if anyone else then me participates the
development, otherwise I'll release it as shareware-binary-only.

--

Ciao, Peter

Hi!

I am doing some cgi-programming offline on the good old 68000. It works pretty well except that the implementation of read() in the mintlib I got from hensa (last year?) is not working proper. Of course, I could then just use the normal lattice lib, but then popen() isn't working!?

The problem with read is that I have only one chance to read in the parameters send to the script. On second access on stdin, they are gone. So any pseudo read() using the buffered filesystem will fail.

Any ideas? Related problems?

I think I made it emulate MultiTOS when I wrote this routine oh so long
ago. I'll go back and test, though, to make sure. I agree that it would be
nice to have it use the TOSRUN program if the tos flag is set in the
shel_write() command.

If you run a shell and export some environment variables, they get
inherited by the child processes. But GEM is not a child of any auto.prg,
GEM starts up on its own. That is, unless you boot GEM from your proggie.

If you are under MiNT, you could modify mint.cnf

I'm porting a great Atari ST program to Windows95 and have no
Atari ST documentation. The source code #include's aes.h, vdi.h
and tos.h, it would be useful to have these and some documentation
on the windowing system and graphics routines.
Who could send me those?

Thanks

I'm not going to discuss anything with a "Hater", fanatic prejudices
cannot be discussed.

Actually it's quite normal that you "hate" something doing the first
steps with it. However, I won't allow this feeling to make me abandon the
whole thing, until I've got a reasonable understanding why it is designed
that way. I can well remember how I hated C when I started programming
with it. Nowadays I'm glad that I was stubborn enough to ignore this
feeling for the first million code lines. It wasn't until then that I was
able to appreciate the way it works.

Cheers Peter

Do I have to beware of special things when executing a GEM program
from within a GEM program (with Pexec)? The code I have written works
flawlessly with .ttp programs, but not entirely with GEM programs. It
has (roughly the following form:

```
  close_all_windows;

  if (!GEM)
  {
    v_hide_c(handle);
    v_enter_cur(handle);
    v_clrwk(handle);
    v_curhome(handle);
```

```
  }
  menu_bar(MENU,0);

  Pexec(0,PROGRAM,COMMAND_STRING,ENVIRONMENT);

  if (!GEM)
  {
    v_exit_cur(handle);
    v_show_c(handle,0);
  }
  menu_bar(MENU,1);

  reopen_all_windows;
```

The system hangs during reopen_all_windows when the parent program has more than five windows open. I inserted a form_alert call in the loop, and the first five windows are always restored without problems, but it fails when it comes to the sixth. The funny thing is, it exhibits exactly the same behaviour with the execution of .ttp programs when I add appl_exit(); after menu_bar(MENU,0); and appl_init(); after Pexec();

Am I overlooking something?

A plain old 68000 ST will run MiNT and MiNTnet with no problems. There
is a MiNT port of the X11 server. I've run MiNT, MiNTnet, X, twm and
xvt on my 4Mbyte STE without problems, but this setup works best as an
X terminal rather than for running applications locally.

Hi,

this is for all Atari users who need performance and don't mind an
external power supply.

I want to give away my Atari Mega ST4 for a small amount of money. Over
the last ten years, I added following hardware:

- a 100 MB external SCSI drive
- an ED disk drive (2.88 MB) with Ajax controller
- an ET4000/W32 graphics card
- a 50 MHz accelerator board with
  + a 68030 CPU (the version without internal FPU/MMU)
  + 4 MB fast RAM (plus 4MB on mainboard makes 8 MB)
  + compatibility switch (activates 68000)
  + 68881/68882 socket

Please mail to

    unix111@ai.fh-nuernberg.de

or

MarkoHaas@aol.com

Thanks
Marko

I notice that your code fragment says you are closing all of your windows before running the child. If you don't have a multitasking AES, then there is a limit on the number of windows (7 plus the desktop) which can cause problems for the child. You need to use both wind_close() and wind_delete() on your windows before running the child.

But that's not really your problem. I suspect you're hitting a wonderful bug in Atari's AES having to do with the size of the evnt_mesag() queue. When there are more than some number (I believe it's 8) messages pending for an app, the AES starts to get confused. However, this shouldn't happen unless there are already some other messages pending when you go to reopen the windows (which causes one WM_REDRAW event per window).

One thing you might try is this:

```
  menu_bar();
  evnt_mesag(buffer);
  process_event(buffer);
  reopen_all_windows();
```

Of course, you could always do this in reopen_all_windows():

```
  for each window {
    handle = wind_create(whatever);
    wind_open(handle);
    evnt_mesag(buffer);       /* get WM_REDRAW */
    process_event(buffer);
  }
```

That way, the queue should never get a chance to fill up. But this is slower because of the extra redrawing that occurs.

When I edit an old NEODESKH.INF file and rename it to NEODESKC.INF they are sitting side by side. On using the Options->Set Prefs->INF Files dialog to force NEODESK to read the new INF file, the dialog window ONLY shows the older
INF file (NEODESKL NEODESKM NEODESKH).

How can I make NEODESK recognize the new INF file.

Hi there,

Could anyone point me to a memory location high up in the dizzy heights of memory where I could read the status of the serial port's DCD line directly? I need to be able to access it from an interrupt handler you see.....

TIA,

Mark.

Three thousand cheers and a million hurrahs for you!!! You have
exactly hit the solution to the problem. I don't know how to thank
you. The bug has bothered me for a long time, and I didn't have the
slightest clue. May your name be written in gold in the GEM annals!

>Of course, you could always do this in reopen_all_windows():

> }

That's where I put it. evnt_mesag(buffer); after wind_open in the loop
was enough. I don't know exactly what you mean by `process_event', but
it wasn't necessary.

Thanks again!

It depends on the port of course. For Modem 1 DCD is connected to Bit 1
of the MFP general purpose I/O port (DCD = $fffffa01 AND 2).

Message-ID: <E86DE2.KCy@cix.compulink.co.uk>#1/1
X-Deja-AN: 230945136
Organization: Compulink Information eXchange
Newsgroups: comp.sys.atari.programmer

Here's a problem I've spent hours on and can only conclude that there is a
bug in NVDI or the Lattice C libraries.

If I get a list of the fonts installed on a system and check fontname[32]
for the bitmap/outline flag all is OK the first time. Do it again and all
the fonts are flagged as outline.
I've used vqt_name() and vqt_f_name() (Lattice C only function?)

A code extract is thus:

```
int main(void)
{
appl_init();

showfonts();/* all OK, bitmap fonts shown as such */
getchar();
showfonts();/* bitmap fonts shown as outline */
getchar();
```

```
appl_exit();
return 0;
}

void showfonts(void)
{
char fontname[32];
int workin[11] ={1,1,1,1,1,1,1,1,1,1,2}, workout[57];
int dummy;
short i, handle, type;
unsigned int font_id = 0, totalfonts;

handle = (short)graf_handle(&dummy, &dummy, &dummy, &dummy);
v_opnvwk(workin, &handle, workout);

totalfonts = vst_load_fonts(handle, 0);

printf("Total fonts available: %d\n", totalfonts);
totalfonts++;/* add one to include system font #1 */

for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_f_name(handle, i, fontname, &type);
printf("%-3u  %-5u  %d %s  %s\n", i, font_id, type,
(type == 1) ? "Outline" : "Bitmap ", fontname);
}
OR
for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_name(handle, i, fontname);
fontname[strlen(fontname)] = '\0';
printf("%-3u  %-5u  %s  %s\n", i, font_id,
(fontname[32] == 1) ? "Outline" : "Bitmap ", fontname);
}

vst_unload_fonts(handle, 0);
v_clsvwk(handle);
}
```

The problem sems to be with vst_load_fonts(), I've played with everything there is leaving out some calls, repeating some to no effect.

Anyone come across this problem?
Thanks

Slainte mhath
Mark

Ok Mark, forgive me if I'm wrong, but declaring a string variable 32
bytes long gives you indexes 0 thru 31. fontname[32] is undeclared
and is probably the hi-order byte of something pushed on the stack.

I would declare fontname[35] and see if this doesn't solve your
problem.

John

You could always hide the mouse (or create an invisible one), call graf_mkstate() or vsm_locator() repeatedly and draw the box using v_pline() in XOR mode (drawing it a second time at the same location deletes the original).

However, to get any sort of speed out of it you should do the interface in assembly to avoid the overhead of the C bindings. All my experiments with vsm_locator() were horribly slow.

I suspect that graf_rubberbox() uses LINE A or the equivalent level display/mouse functions itself.

p > I'm not going to discuss anything with a "Hater", fanatic
p > prejudices cannot be discussed.

I didn't write the book, I just read it. Most of the authors have obvious and sometime silly biases (I recall one going on about how 1 mouse button was better than having 2 or 3), but it serves as a invaluable reference on UNIX bugs, and some of the humor is priceless.

p > I can well remember how I hated C when I started programming
p > with it.

I didn't, and it was something like my 7th language (or 3rd if you lump all assembly languages together). Of course, I still have problems using & where I should use &&... OTOH, I LOVE my Pure C shell (especially "check braces" functions), and it is my second C package (not counting make).

BTW, I knew I was starting to think in C when I got on an elevator and asked someone to press 0.

p > Nowadays I'm glad that I was stubborn enough to ignore this
p > feeling for the first million code lines. It wasn't until then
p > that I was able to appreciate the way it works.

I've always thought that the main reason UNIX has even some devoted fans is that (since the learning curve is so steep) by the time you get good at it, you have invested too much effort to throw it all away again for something better (besides, you can now lord it over all the newbies and enjoy their suffering).

But UNIX isn't just hard to learn, it is also plain bad. For example, the way it handles wildcards is incompatible with any command which uses 2 or more pathnames:

```
mv *.c subdir/*.c
```

and kiss your files goodbye. This is a 30 year old bug which will never be fixed as it is too fundamental to how UNIX operates.

This is not to say that there is nothing of value in UNIX,
especially as an experiment in distributed development. But it
should have been replaced long ago with something better thought out.

Hello,

I'm trying to interface the CPU_MOD.BIN code with C. The BASIC code has
something to the effect of:

```
bload "CPU_MOD.BIN", Cpu_Mod%
call Cpu_Mod, ...
```

I don't know the equivilant of these two calls in C.
The author of CPU_MOD doesn't know C. I'm using Lattice C 5.56, and I don't
know any ASM! :(

Thank You!

That might explain what happened when I did something similar (except with
zip files) on my STFM/4 Mbytes/MiNT 1.12.6. Lost the lot, they appeared to
be appended to one file, except it bore no relation the the individual
files.

Given that MiNT is very Unix like, are there any other killer bugs?

I try to make a shell for the gnu c in accessorie (to be used
with Qed). But when i start gcc (it start and work fine) i got
some bombs (when gcc end). the bombs don't disturb my
acc (it can launch a second compilation), but close the

main app. (not only qed, but all apps). it work fine only when
the main app is the standart desktop, or when i run my
shell in app.

Is there something special about the ttp launch in acc ?
(in the present version, it's a call to Pexec (0 ,....) (whith
argv in environment) , but i try Pexec (3,...) ... Pexec (4,....)
or Pexec(6,....) and it's the same thing)

Yup, that's the precise algorithm. Nearly identical code is used for
resizing a window, BTW.

>However, to get any sort of speed out of it you should do the
>interface in assembly to avoid the overhead of the C bindings. All

Geneva's routine to do this is in C. The key is to only redraw the lines
when the mouse has actually moved. If you update continually, it's dog
slow.

>I suspect that graf_rubberbox() uses LINE A or the equivalent level
>display/mouse functions itself.

Nope, even Atari's AES uses the VDI for this.

Just what is a Unix bug? There are bugs in the dozens of different flavours of Unix, certainly, but there is no one bug common to all of them - unless, of course, you know different. You can't talk about Unix bugs in the same way as you would talk about Windows or TOS bugs.

Perhaps you just don't have an aptitude for C programming. (:

That's a bug in whichever shell happens to damage your files, not Unix itself. (I know of no shell which will do this, although that's not to say that none exists.) The distinction between shell and kernel is fundamental to how Unix operates. It would be perfectly possible to write a Unix shell

which behaves like e.g. DOS and doesn't expand wildcards before passing argument lists to programs, but that would truly suck. Every single program which could conceivably take multiple arguments would need to be able to expand wildcards itself - a tremendous waste of coding effort, not to mention memory and disk space. If you don't like the fact that the shell expands wildcards for you, that's just too bad. I don't like the fact that DOS doesn't.

This has nothing to do with how unix operates, more with which shell you use. Globbing in ie tcsh or bash is much more powerful than for instance msdog's cli. It is also consequent and logical. I don't understand your example either. Why would you want to write it that way under any cli when not changing suffix?

/Christer

Hi!

In article <dwilga-0304971205560001@wilga.mtholyoke.edu>,
dwilga@mtholyoke.edu (Dan Wilga) writes:
> I notice that your code fragment says you are closing all of your windows

> wind_delete() on your windows before running the child.
If you're presuming the use of AES >= 1.4 (i.e. TOS >= 1.4), you may use
wind_new() to get rid of all windows at once. This also takes care of open
accessory windows, which must also be closed before and after running a GEM
application from within another GEM program.

For AESes prior to 1.4, you may use a "dirty" method: Loop from 1 to 7 and
call wind_close() and wind_delete() for that windows. Afterwards, send
AC_CLOSE to all ap_ids from 1 to 6.

Don't use the above method if appl_getinfo() is available and tells you that
wind_get(WF_OWNER, ...) and appl_search() are supported. In that case, you
can use wind_get(WF_OWNER, ...) to close and delete only those windows which
are really open. Afterwards, use appl_search() to get the ap_ids of all
running accessories and send them an AC_CLOSE-message. Note again that this
is only necessary if the AES version is < 1.4, but appl_getinfo() tells you
that the mentioned functions are available. This may be the case for TOS 1.2
with WINX installed, for example.

Even when appl_search() is not available in the above mentioned case, you may
still send AC_CLOSE to the owners of the windows you have closed and deleted.
But only send the message once to each affected application.

Hope that helps ...

Ciao

Thomas

Your comments surprise me. The examples you cite have nothing to do
wit UNIX per se. They have to do with the software that is written on
the basis of the OS. While not totally unfair to equate UNIX with
everything that is traditionally to be found in /bin, it is also
missing the point. There is nothing "fundamental" about how a program
like mv works. In fact, there are many different versions in use
today. I tried your example on two different UNIX machines, and one
ended up with only one file called subdir/?.c, while the other did
nothing but prompt a usage message:

```
mv *.c subdir/*.c
usage: mv [-if] f1 f2 or mv [-if] f1 ... fn d1 (`fn' is a file or directory)
```

It stands to reason, of course. Besides, from a programmer's point of
view it doesn't matter what is or is not in /bin. Of course, you could
make it easy on yourself and use system("mv ..."); if you want to move
a file, or system("ls ..."); if you want to read a directory, but that
is not the proper way to go about it. The OS is superb, a joy for
every programmer - if I may say so.

Not quite. I do something like this all the time. However, you entered the
command wrong.

mv *.c subdir

will send it to the right place. I've always done it slightly different.

mv *.c $HOME

or

mv *.c /tmp/files

does it every time. To explain to others what the $HOME is, it's a variable that holds your home directory. Mine is /home/rsg0910. Saves loads of typing when I mv * $HOME, to move stuff from the temporary directory I'm in to my home account.

Once I made the mistake of doing an 'rm *' in my home directory. You can guess the rest. Fortunately, I didn't lose too much since that command didn't delete the directories. However, an 'rm -rf *' will.

But of course, Unix can be hard to learn if you aren't willing to learn. A shell account can do wonders for your learning at times. There's a few good books out there that will help.

I've also been on the VAX systems. Both operating systems have their quirks, but they're useful to some extent.

I mainly hated it because it's philosophy wasn't clear to me. Took me
ages to figure out the difference between
char d1[] = "abc";
char *d2 = "abc";
strcpy (d3, "abc");
and caused lots of crashed in my early programs which were really hard to
find. Apart from that, the compilers were stupidly buggy at the time, and
coping with Alcyon C' or Megamax C's bugs is not a newbie's thing to do.
Turbo C didn't exist at the time.

It simply is not a bug. It is a straight consequence of the shell
philosophy under Unix. You _think_ it's a bug because you're used
to a slightly different meaning of wildcards under other OS. Probably
nobody ever had called it a bug if not the '*' had been used, but some
other character, because then it's obvious there is a difference.

If you wanna start using a different OS than the one you're used to, it's
essential to free your mind and throw every habit overboard you learned
from the earlier OS. This of course becomes increasingly more difficult

while you improve your skills in handling that earlier OS. If you'd done
that then it had never occured to you to think "Yeah, that '*' is a wildcard,
thus 'mv *.c subdir/*.c' must work."

> This is not to say that there is nothing of value in UNIX,
> especially as an experiment in distributed development. But it
> should have been replaced long ago with something better thought out.

So you're saying the millions of people that put their thoughts into Unix
were not capable of doing it right ? Isn't that a little presumptuous ?
And under that attitude, how do you explain the recent success of Linux ?

Cheers Peter

Hi,
I am working on a Java port of the STonX St emulator, and I really
could do with some technical docs right now.

Can anyone give me some pointers (preferably for the net?)

Thanks,
Dave Dawkins

Pexec() from a DA was never officially supported until MultiTOS. While it does work to execute a 100% TOS program, you will get a crash if the program does even so much as an appl_init(). No AES calls at all can be used in the child. I don't use GCC; perhaps this is the reason for the crash.

As it turns out, wind_new() has a bug of its own: Under TOS 1.4, the first window opened after a wind_new() doesn't respond to mouse clicks under certain conditions. You have to fake it out by briefly opening a small

window offscreen.

The problem with sending AC_CLOSE to DA's is that there are a good number of them which really do check to see that word[3] of the buffer actually contains the menu identifier of the DA. And there's no way short of intercepting all menu_register() calls to know this value.

While sending AC_CLOSE without the ID is still better than not sending it at all, it's not perfect. Why not just do an appl_exit()? That always sends AC_CLOSE properly to all DA's, and it even closes the windows for you. (This assumes singletasking AES, of course.)

> got against the good old 8bit?

Hey Eric...

Good to hear from you again, and I really hate to inform you of this, but
the ST is not an 8-bit machine!

I have, however, gotton that ol' 800 working well with the disks and
everything... so I'm looking to move some basic-type stuff onto the
floppies for that as well.

My question is this: Does an ST have an SIO interface to hook up 8-bit
peripherals? I'm getting an (Not old - middleaged) 1040ST in May.

Cya l8r,
"Merch"

The ST is 16 bit... Frank is talking about the relatively old Atari XE etc!

No, but there was a custom cable designed for use with Darek Mihocka's
8-bit emulator on the ST. I can't remember Darek's e-mail address, but
his company (which markets 8-bit and ST emulators for the Windoze) is
called Branch Always Software (BRA-Soft) and is on the web... perhaps he
still sells these cables?

ST+ ISSUE 14
The Monthly ATARI PD Diskmagazine
http://www.geocities.com/TimesSquare/Alley/7454/
Editor Dave Hollis
Compatable with All ATARIs Min 1 Meg,
ST, STe, Falcon, Mega's and TT

ST+ Has been released at the end of every month for over a year now, At last it is on line and available for download from its new home at the above url, the page is under construction so bookmark it and keep going back, not forgetting your RELOAD/REFRESH Buttons :)

You will have to hurry for Issue 14 as ST+ 15 is due for release at the end of March,

** NOTE ** PaCifiST users can downlaod the diskzine as a ready to use PaCifiST image file to run in your brilliant ATARI emulator, just go to the page and follow the links.

This Diskzine is Free, Its Current, Its got loads in it and it is released EVERY Month

Heres a list of what you can read in this issue.....

** NOTE ** This is NOT a STOSSER Software release, I make the Diskzine shell for this and many other current UK Diskzines, However Much needed Feedback, Comments, Snippets and maybe even Articles, as well as reviews, messages and Letters, can all be sent to me at stp@stosser.airtime.co.uk and will be instantly passed on to the Editor Dave hollis.....

ST+ 14 INDEX OF FILES

REGULARS

[] THIS ISSUE.....This file...
[] SHELL INFO.....Some info to get the best out of ST+.
[] WELCOME AGAIN....My usual bit from me, myself and I.
[] CONVENTION REP...More info on this great idea.
[] CONVENTION INFO..CiH has a few things to tell ya.
[] READER LETTERS...More of your views and suggestions.
[] NEWS.....Only a few bit's this month.
[] STOCKMARKET.....Reader adverts.
[] QUESTIONNAIRE....Reader feedback,
[] KONTACT KORNER...Wanna get to know some new Atari users

ADVERTS

The following are commercial adverts...

{} ALIEN TECHNOLOGIES.
{} ANALOGIC.
{} FLOPPYSHOP.
{} FLOPPY PHOTO's.
{} GASTEINER.
{} GOODMANS INTERNATIONAL.
{} PROPHECY PDL.
{} TITAN DESIGNS.
{} A.S.P.

OTHER ADVERTS

The following are misc adverts, important nonetheless.

* ALL AT SEA BBS.
* MAGGIE DISKZINE
* WARP DISKZINE
* KELSTAR DISKZINE
* STOSSER.

* ON THE HORIZON.
  A NEW BOOK..

ART GALLERY

[] CLASSIC MOMENTS - Jody D'art..
[] HAPPY BIRTHDAY - Almost as good as a card..
[] SMALL REMINDER - Just in case you forget.
[] MARBLE ARCH.. - A great piccie I found that impressed me.

SCI FI CHANNEL

{} THARGOIDS... - A story by Martin.

ASSEMBLY

HELLO THERE - Steve seems in a better mood, find out why.
ARRgghhhh!!! - But then he's off ranting again..
PICTURE BOOTIN' - A reader letter answered.

RESEARCH

{} JODY'S BACK.. - ...with a vengeance.
{} DANDY KANDY - And more grumbles.
{} COMPUTERS Pt 1 - A brilliant bit of research from Colin.
{} WHERE ARE THEY? - And then some from Jody.

MUSIC'N'MIDI

[] BACK AGAIN... - More jivin' from the man Nev.
[] TRACKER COMMAND - Tracker commands made simple.
[] MUSIC REVIEWS - Pretty self explanatory really.
[] MISCELLANEOUS - The bit's that didn't fit anywhere else.
[] GOTTA FLY.. - And it's goodbye from him.

CONSOLE CORNER

' NINTENDO 64 - Is this REALLY the wonder machine..?
' VIEW POINT.. - Sega Saturn game review.

FALCON

+ THE FUHER... - More from Martin.
+ 030 GAMES - Some Falcon compatible games.
+ LOST BLUB DEMO - Falcon super demo,.
+ FALCONS & ST+ - Compatibility central,
+ THE TWO REVIEWS - More falcon reviews

REVIEWS

* DBWriter - As if I didn't do enough word processing...
* KEEFY'S BIT.. - Mr warp's loose in this very mag..
* DOMINOES - Review of that all time classic mind game
* I.C.B.I.S. - STOS users read on..
* BACKGAMMON - Another mind game..
* GHOSTLINK - Fancy using a PC as a slave to your ST?..

DISKMAGS DEPT

A FEW FACTS.. - Wiggle central..
EEZI-PC - A review of by the Maggie team.

HARDWARE

- ZIPPIN ALONG..Feedback regarding last month Feature

FEATURES

() GEM'ulators..Tony Reviews (PRE PaCifiST)
() ATARI v PC - Which is best (as if we didn't know)
() MORE GRUMBLES -Is there no-one who's not moaning?.
() C TUTORIAL pt2 - More help with C programming.
() I SEE THE LIGHT - Disheartened ST users read on..
() A FEW IDEA'S - Actually, a LOT of idea's..

() NEXT MONTH.. - The not so final curtain..

Cheers !ynoT (ATARI Programmer)

He's serious. I've done programming in Cobol as well. So, in essence, that

makes it a valid question. I've not found it yet. I'd like to get a copy
of this as well.

However, there's C, Basic, assembler, and other packages galore.

COBOL is icky, that's why! It's such an impossible language, anyone would be
better off learning C since it's actually viable.

I use STOS myself! :-)

I see you've never tried programming in it. I have, and have programed
quite a few things in it. Sure, C is good, but there are some rather
wicked things you have to learn that make it a little hard in some places.
However, Cobol can be weird, since it doesn't have the math things,
rather, you have to ADD x TO y, SUBTRACT, and then some. That makes a
normal one-line calculation into around several lines of Cobol.

Actually, I've been forced to take classes in COBOL. Not getting into any specifics
or anything, but you have to type a lot of code to get few results. I'm sure it has
it's benefits, but just TRY to get instant results like you can with BASIC. And C is so much faster...

My biggest beef was those #$%*! periods after each line. Ewww...

I suppose you're right, but since environmnt variables do exist and
are used (notably the TZ variable), I thought I would use them too.

>Re. environment variables: it's bad enought that we have to support

I never thought of environment variables as bad practice. Maybe
because I tend to look at Unix as THE example for any programming
environment. Why, in particular, do you think it's bad practice?

Not so. There are plenty AUTO folder programs that set environment
variables during start-up and they don't "go away". But even if they
would go away as soon as MiNT or the AES comes up, why aren't the
available to other AUTO folder programs that come after the env var
program?

A while ago, I had a program sat on my hd that ran through a path of Windows .ico files and produced a .rsc file of them.
They could then be treated as Atari icons.

Of course, now I need the thing, I can't find it! :(

Has anyone got an idea of what this program is called and where I can find it?

TIA, Gary

His company is now called Emulators Inc. I wonder if Darek works for
MS, he is in the same neighborhood.

j > bad practice?

First of all, I abhor using text (command lines, environment variables, scripts, etc.) for program-to-program communication. Admittedly it makes the data user editable (technically), but expecting the average user to be able to edit such text is to make the program difficult to use (e.g. HSmodem). If the user is NOT supposed to edit the data directly, then leave it as binary (which is smaller and easier to process). This is why I prefer the cookie jar to the environment list.

Second, if every program on your computer used one or more environment variables, imagine how big and cluttered the list would become, and how long it would take to scan through the list to find what you were looking for, not to mention how complicated the script needed to boot up with would be.

What environment variables are good at is multi-user systems where each user wants to get different results from the same program. Specifically, it is needed to locate the user's directory to FIND the appropriate *.inf, *.cfg or *.dat file. It is a solution to a problem which does not exist on single user computers.

As for UNIX, I have used many operating systems on many computers in my career, but was aghast at my first exposure to UNIX. How such a godawful collection of kludges and quick-fixes ever became an industry standard is a mystery! I suspect it had something to do with the price (which is more than compensated by lower productivity, but you don't find out about that until too late).

I don't know of this specific program, but Interface and the ZOOM icon
editor is also able to import Windows icons. Both are commercial
programs, though.

All the best,
Daniel

He was hired by Microsoft right out of college years ago, and he was
still working for them when I met him about 18 months ago. So he's
probably still there.

That's ICO2RSC which you are looking for.
I have set up a page for these hard to find file. You can find ICO2RSC at

  http://probehouse.home.ml.org

under the Useful Software section. More coming soon.

: Actually, I've been forced to take classes in COBOL. Not getting into
: any specifics or anything, but you have to type a lot of code to get few
: results. I'm sure it has it's benefits, but just TRY to get instant
: results like you can with BASIC. And C is so much faster...

Forced, as in a requirement? Since I'm familiar with Cobol, I'm familiar with the requirement of a lot of code. I had to write a mail interface program for this one company, and they were on a mainframe system. So, that meant I had to wait awhile before I could get the damned printout, and so on. It's perfect for business. I'm getting a copy of a compiler for my 486 just so I can remain in practice. [sigh]

But of course, it would be nice to have a computer that would allow you to do Cobol programming the way Basic was done. Just program, and type RUN. I'm still learning C.

That reminds me... Is Steve Yelvington, author of the MODEMIO text file, still around? That file he wrote was back in 1990. Is there a current version of this?

: My biggest beef was those #$%*! periods after each line. Ewww...

Tell me about it. I regularly forgot to put the semicolons in Pascal. With C, you still have to worry about the periods. Not so with Basic. And they claim it's a dead language? ye gods...

I wrote a short accounting program for this one business, and purposely put in one bug, to ensure they called me back. Guess what? It's been 8 years now.

However, now that I think about it, if you install MiNT, and can find GNU Cobol around, and compile it, that could probably do it.

Really... Well, you learn something new all the time, as the saying goes.
If anyone has any sample code for modifying the vars so that they are
persistent, I'd be interested in seeing it.

From my understanding of the original post, the person wanted to create
vars from the AUT ofolder and have them persist even once GEM had loaded,
which I had previously thought would not be very easy to do. I wasn't
denying that you could create env vars that would be available to other
AUTO folder progs.

Of course, this is all pretty much a moot point, since it sounds like he's
going to go with a different method anyway :-)

NeoDesk's icon editor can also read .ICO files directly. But if you really
want them in .RSC format, this won't be of much help.

Hi ppl:)
thanks for all the reply but I finally found what was wrong..
My compiler wasn't patched.
But now (once patched), everything's fine :)
Thanks again.... bye

[followups in tech group only]
[posted also to NOS mailing list]
[no crosspost to demon.ip.support.atari, they are not concerned]

Hello all!

Many news servers update their software to INN 1.5 or 1.5.1. They'll update faster to 1.5.1 now, after the "all-time bigest Usenet attack" last week, as 1.5.1 is the only server protected against this cracking method (well there are patches for some other servers, but...).

This leads to problems for us NOS users, as this versions disable NENNEWS command by default, we receive "502 NEWNEWS command disabled by administrator" and the sessions fails, no news... Well we can post our messages, as they are posted before the get news procedure. Maybe it's time to change NOS's strategy to get news, the NEWNEWS command is supported by less servers each day as it uses on the server more memory and CPU time than any other nntp command.

In the meantime, if you can, ask your news administrator to change his config.data file, partial quote below:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
##  Allow the NEWNEWS NNTP command?   Pick DO or DONT.
##  (RFC 977 says you should; your server performance may not agree...)
##### =()<ALLOW_NEWNEWS          @<ALLOW_NEWNEWS>@>()=
ALLOW_NEWNEWS           DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Easy to guess, he must change the "DONT" to "DO" in the last line. Perhaps he also needs to recompile INN, or only to restart it, it's not clear for me. While we're with config.data, there is an option (on by default) to slow down service for offline readers. Another partial quote:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
##  Do you want to make life easy for peers to pull feeds from you (it's
##  harder on your machine). Pick DO or DONT. With DONT, you get a small
##  sleep inserted before each ARTICLE command is processed. (With
##  apologies to the Australians in the audience).
#### =()<LIKE_PULLERS           @<LIKE_PULLERS>@>()=
LIKE_PULLERS            DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Same thing here, change last line into "DO", if you have a nice newsmaster he'll do it. Otherwise you have a one second pause between each article. And if someone could explain me the "Australians" stuff...

Bye! Bruno.

I wonder if anyone took advantage of Atari's "Valuable Voucher" they included when buying the 1040ST. When I bought my ST in 1987 I was tempted to take advantage of buying the "BOS/5 Operating System" and the "BOS/MicroCobol Development System". They also offered various accounting and office products written in MicroCobol.

I filed the voucher away with my manual and forgot all about it until last year when I came across it again. I was tempted to fill it out and send it to "BOS National" in Dallas, Texas just to see what kind of reply (if any) I would get.

This is the only Cobol for the ST I have come across.

>So why my acc doesn't receive the correct signal when the machine
>boots in mint?

It sounds like the acc is doing some I/O, either through the BIOS or
GEMDOS. If you can't see where in the code you're doing this (print
statements, perhaps?) then it could be a GFA library problem.

The best solution is to stop doing BIOS or GEMDOS output from the ACC.
If this isn't feasible, a work around would be to do the equivalent
of the C calls:

```
     Psignal(SIGTTIN, SIG_IGN);
     Psignal(SIGTTOU, SIG_IGN);
```

somewhere early in the code -- this tells MiNT not to suspend the
process if it does I/O on the console.

Ermm... Yes. I don't think the teacher was all that thrilled with it either. Then, when I took Turbo C++, that teacher absolutely DESPISED COBOL! I really hated it so much because it seems so wordy. And I would always forget a period somewhere which would cause about 15 errors. It would take me an hour to write a program that would put my name on the screen! Something I can do in BASIC in about... 3 seconds?

The sad part is: I was really excited about learning it. Until I learned it!!

> claim it's a dead language? ye gods...

BASIC dead? Puleeze. BASIC will be around for a VERY long time to come. What? Are they going to train people programming on Turbo C++? That's not a good starting point for a programmer.

> However, now that I think about it, if you install MiNT, and can find GNU
> Cobol around, and compile it, that could probably do it.

If you can find GNU COBOL around, it could be recompiled for Linux, and you could run it on the Falcon!

BTW, what was the latest revision for COBOL?

hi,

Does anyone know the address of the dsp boot program wich is in the
memory map of the tos?

How many memory is there in each part of the dsp
for p,x and y

(i think about non shadowed memory, wich mean a really mermory where i
can set a word without erasing another part of the dsp memory)

thanks

Sometimes Cobol does require a little more time and thought to come up
with a good program. When I was in this class, and someone complained
about a variable, I always told them to look up, at the beginning of the
program. The error was usually right there. Later on, I'll try posting a
short quickie program that'll put someone's name on the screen, then
compare it to basic, C, and maybe Pascal.

: The sad part is: I was really excited about learning it. Until I learned i

The interesting thing is that when I learned it, and we got to the point
of 2D or 3D tables, I was at the point where I could, literally, do a
10-dimensional table, and finish the program before everyone else.

: BASIC dead? Puleeze. BASIC will be around for a VERY long time to come. Wh
: Are they going to train people programming on Turbo C++? That's not a good
: starting point for a programmer.

Basic has the problem of not being structured, what with all the GOTOs and
GOSUBs, depending on the flavor of Basic you use. The first few programs I
wrote in Basic were on a TRS-80, of all things. One was a slot

machine-like one, another one was like the Simon game, where you remember the colors, and a few others. I don't know what happened to them.

What is a good starting point for a programmer? People have started learning with various languages out there. I've seen some actually do some Fortran, and the entire program looked like a mess. The first C program I wrote used Mark Williams C, and I bought a used copy of Lattice C 5.5 something, so I really need to get back to it.

: If you can find GNU COBOL around, it could be recompiled for Linux, and you
: could run it on the Falcon!

I may have confused it for GNU Pascal... But of course, you can do that. That's one reason why I like the GNU things, since it can be recompiled on various systems out there. Only problem is that I've not installed Linux on my DX4-100, or MiNT, though I have a Sun 3/60 diskless workstation. Still am trying to learn it. It's got an ESDI drive in it, though I'd like to try to replace it with a SCSI.

: BTW, what was the latest revision for COBOL?

Last I heard, it was around 1990 for the latest revision. It's been awhile since I've done serious work with Cobol.

Newsgroups: comp.sys.atari.programmer

In the process of developing an RTF decoder, I wrote a program to generate a "packed" hash table from a list of code/keyword pairs and save it as a DRI format object file. I was wondering if it was worth uploading?

The hash table uses the structure

```
typedef struct {
  short parent;  /* index of parent node */
  short base;    /* used to compute child indexes */
  short code;    /* keyword code (or default code) */
 } PACKED;
```

and computes the hash table array indexes using

```
  index = p->base + (unsigned char) *(text++);
```

The program can usually pack all of the nodes into an array with no wasted space and no conflicts (looking up a keyword of length n requires exactly n table lookups).

Packing the 34 C language keywords took a couple of seconds, while packing the 536 RTF keywords took about an hour (on a TT). A faster solution is also possible by increasing the array size.

BTW, I am familiar with the so called "perfect hash," which cannot distinguish keywords from typos without a string compare.

> can set a word without erasing another part of the dsp memory)

This is pretty complicated on the Falcon, and I don't have the exact memory map in my head. But this is approximately how it is. (words in here are 24-bit DSP words)

Internally in the DSP chip there is 512 words P(rogram) memory, 256 words X memory and 256 words Y memory. These are always free to use without risking overwriting other parts. But, the first 64 words in P mem is used for interrupt addresses.

Externally, there is a total of 32K words, divided in two 16K words parts. These parts are the lower 16K of the X and Y mem respectively.
The P memory is then mapped over these parts to form a "separate" 32K program memory. The lower 16K of the P mem is the same physical mem as the 16K Y mem and the upper 16K P mem is the 16K X mem.

There are parts missing in the description, among other things what happens when the X and Y memory ROM are enabled. This is where my memory lacks. I checked this once and made notes of it, and they are somewhere :)

If you have Brainstorm's DSP debugger, it's pretty easy to check exactly which parts are mapped over other parts.

Greeting,

Tomas

Hey all,

I was just rummaging around my TT's registers a few nights ago and I noticed that it has the STe's shifter address low register ($ff8205 IIRC), which lets me set the screen to any 8-byte boundary. But there seems to be no smooth-scroll register ($ff8265?). It seems strange there would be only 'some' of the STe's video functionality in the TT. (Also I noticed that $ff820b, which is described only as 'reserved' in the TT tech docs, definitely does things to the VGA display if you diddle bits 1 or 2).

Anyone know the scoop on this?

Thanks,

-Russ

I wouldn't exactly call it a problem. BASIC is more flexible because you can structure it as you wish. I used to do spaghetti code, because I didn't know anything else. But, learned it was better to AT LEAST have modules. GOTOs aren't bad. You just have to avoid abusing them.

> What is a good starting point for a programmer?

I still think BASIC is the best starting point. After all, that's what it was intended to be: Beginner's All-purpose Symbolic Instruction Code.

Hmmm... I think I learned on COBOL 85. This was back in '90, so it must have just been about to appear. What an ordeal. Glad I'm not going into mainframe programming!!

Programs should be written for the largest number of people possible,
not just the lowest common denominator. While I agree MOST users will
not edit the data from a program directly, having this at ones
disposal is greatly appreciated with the need arises.

The biggest reason to use the cookie jar over the environment on TOS
has to do with the various shells it use. Yes, most users are using a
shell, but don't realize it is a shell because it is graphical.
NeoDesk, Ease, the Desktop built into MultiTOS as well as MagiDesk
that ships with MagiC are all shells. They are just graphical, but
none the less shells. These programs wouldn't know that the
environment has changed and as such, they would not properly pass the
envirornment to the next program. The cookie jar would solve this
problem, but then you are using precious RAM to store program to
program information that may be better suited to a temporary file.

>Second, if every program on your computer used one or more
>environment variables, imagine how big and cluttered the list would
>become, and how long it would take to scan through the list to find
>what you were looking for, not to mention how complicated the script

>needed to boot up with would be.
>

I agree that for the novice user this can be a pain, but everything in the computing world has a purpose. One should pick the BEST solution that is feasible.

>What environment variables are good at is multi-user systems where
>each user wants to get different results from the same program.
>Specifically, it is needed to locate the user's directory to FIND
>the appropriate *.inf, *.cfg or *.dat file. It is a solution to a

>

Environment variables are also good the store user custom options, without taking up a large quantity of disk space for what is really a small amount of information. Remember, config files eat 2k or more depending on the format of the disk. This is a lot of space for 10 bytes of information.

The Unix philosophy is that each program should do one thing and do it well. This leads to lots of programs. The rest of the programing world has decided that one program should do everything conceivable, which leads to program that are large and do nothing well (the Microsoft Kindom comes to mind).

These are just MY opinion.

There were some programs I'd seen that looked more like spaghetti code
than anything else. Unreadable stuff, you couldn't even tell what the
program did due to all the jumping and so on it did. I heavily modified a
Forem XE BBS program, rewriting a couple routines and so on, making it
work better. It had modular areas, and you could tell.

The GOTOs are unconditional jumps, which force the program to go
somewhere. GOSUBs merely tell it to go one place, then a RETURN to have it
come back to where it started. On an 8bit, if you do;

```
1 GOSUB 1
```

You'll end up with an out of memory error. It uses memory to keep the last
known line number where it jumped in a stack. A RETURN pops that number
off the stack.

A BASIC program without them can easily be readable, yes, but you do need them at times.

: I still think BASIC is the best starting point. After all, that's what
: it was intended to be: Beginner's All-purpose Symbolic Instruction Code.

Some other people don't seem to think so. They say it promotes unstructured code writing. This was long ago, around the 80s. Today, you got the more modern flavors of Basic that have modular areas, without using line numbers.

: Hmmm... I think I learned on COBOL 85. This was back in '90, so it must

Mainframe programming is something I definitely don't wish to do again. It was the JCL, and other things I had to deal with as well. I have a book around here that mentioned the latest Cobol reviews, but I can't find it at the moment.

I cannot make Neodesk 3.02 recognize a new INF file.

After upgrading to a video card, I edited an old NEODESKH.INF file for a resolution 1024 x 768 (256 colors) and renamed the file NEODESKC.INF.

The file NEO_INF.DAT contains the words NEODESKL NEODESKM NEODESKH but any attempt to edit NEO_INF.DAT causes NEODESK to crash on startup.

Any help would be appreciated.

Regards
Jan

The environment is also stored in RAM, generally takes more than 8 bytes per entry, and must be searched by string compares (instead of a single long compare per entry).

b > The Unix philosophy is that each program should do one thing
b > and do it well.

I wasn't aware that UNIX had a design philosophy; it just grew.

A case in point is termcap, which was intended to solely to enable vi to use more advanced terminal devices (than TTY). Someone else wrote a library of graphical interface fuctions called curses to use termcap. However, since termcap does not bother to implement anything not used by vi, it has a very limitted capabilities.

X Windows, on the other hand, is HUGE, really really HUGE! You need virtual memory just to run the thing. The programmer's reference manual is thicker than most telephone books. In fact, it is so difficult to use (without motif, anyway) that for 10 years there were only 4 applications: xterm, xload, xclock and a window manager.

"If the designers of X Windows built cars, there would be no fewer than five steering wheels hidden about the cockpit, none of which followed the same principles -- but you'd be able to shift gears with your car stereo. Useful feature, that." - Marcus Ranum, DEC

Hi all.

I have a problem I hope someone can help me with:

GFA works _VERY_ unrelyably with the setup in the subject line (MagicMac 2.02, MacOS 7.5.3 revision 2, GFA 3.6TT, A la card 1.4 & I have tried both GFAMASIC & GFA Patch 1.07,96MB RAM). I also tried MagicMacs PCI FPU patch, but it stated that no patch was neccesary...

Programs that I know are OK suddenly throws up a number of exception errors & chrash MagicMac. I have to turn to my old MSTE to get anything done... :-(

Any help? I suspect the problem is related to the fact that the 8500 is a PCI machine, but do not really know what that is... It worked great on the 7100 I used to have.

Bye,
Vegard Hofsoy

Um...Excuse me if I'm missing something obvious, but why do you need to edit NEO_INF.DAT? Why don't you just use the Options->Set Prefs->INF Files dialog? That's what it's there for, after all...

It can be done in a higher level language, however, if one inserts a JSR

to an initialisation routine, passing a pointer to the Toolbox info structure passed to the extension.

If the extension needs to allocate RAM or if anything in the HLL library needs to be initialised, then the code as presented will need patching.

I wrote the extensions in assembly primarily due to the fact that the machines that run the code are ram-starved (generally one meg or less). A HLL extension would gobble up around twice the RAM. And most of the extensions were hardware level - and I haven't used a HLL that generates interrupt code fast/clean enough to use at that level.

I've had limited success changing the parent pointer in the extesnions basepage to point to the Toolbox basepage. This sometimes allows an extension to outlive the client app that loads it. But it is not totally foolproof. Fate has just invented better fools.

> You could argue that modules can be used in a simgle task environment to
> facilitate plug-ins to programs (file filters to load different formats of
> pictures/sounds/text/etc) but a TSR system would miss out on the whole code
> sharing idea.

The client app calls the Toolbox to load "GOOBER.TE". It does so, and passes back an ID used when calling functions within goober. Client #2 (perhaps a co-resident accessory) finds that goober is loaded (via a tlbxHasLib call), and uses the ID returned from it to do something, after calling tlbxUseLib (or should that be tlbxLoadLib, bypassing the physical loading/initialisation if it already exists, and just passing back an ID) to inform the Toolbox of one more client that wants to use goober. Both clients call GOOBER via the toolbox. Neither is aware that another client is using goober. Only the Toolbox knows how many clients are using Goober. It could be two. It could be 17.

Only after all clients have called tlbxLibFree(goober_id) will goober be physically unloaded, and the memory space reclaimed.

> The trick is to make the program that governs your modules (Toolbox
> manager/component manager) a process that is always available.

Done. A TSR is always available. And mine is available to be called via a redirected TRAP vector. (And it is XBRA compliant, calling the previous vector holder if/when the API reequirements are not met)

> My component

I never had to use DOS or Windows, so can't compare. I worked on mainframes and workstations from 70-90.

For most operating system, there are a few things that are not solved well. When citing this as an example, you should note too that nowadays programs seldomly use TERMCAP anymore.

> >X Windows, on the other hand, is HUGE, really really HUGE! You need

X Windows is not too huge to fit in a few megabytes : I had it running on an old ST with 4 MB, no virtual memory. Surely it was rather slow with an MC 68000, but this should certainly tell that it's not as huge as you say here. Huge is just your exaggeration.

Ask this person where DEC's GUIs are nowadays, ask him where Ultrix has gone. X however is still very much alive. This should tell which GUI had the better design.

Cheers Peter

Help... ;)

I need help writting (a little) a GFA basic TSR...

I know what to do for most of it, but I need help on some weirder concepts...

If you CAN help me PLEASE email me so I know to come back to this newsgroup...

I am going to write a small auto folder .PRG that will install itself to run when the interrupt for MIDI IN port is generated... What I need this program to BASICly do is...

act as a MIDI THRU when I'm NOT running my music software.... In other words when I'm online w/ the computer and I wanna play my midi rig it'll be waiting in the background for MIDI port input... then it'll grab that vector and take the byte that's in the MIDI IN port and send it to the out unchanged... It's a TSR... I don't want an ACC...
Also I'd like a hot key combo to make it go DORMANT (set vector back to normal) and watch they keyboard for the hotkey combo again to come back to ACTIVE...

I need to know if it's is possible to READ the MIDI in port WITHOUT clearing the byte read? So that after I run my THRU routine I can branch back to the system's routine... Or would it be more wise to just use my own routine all together?

Also in GFA manuals it CLAIMS that you can NOT use pterm resident... Is this due to the effect that it woud have on the interpreter? I mean if I wrote the program WITH the pterm res call in it... and did NOT run it from WITHIN the Intrpreter, but compiled it instead... Would it work then? or do you know if the compiler would filter out the pterm res command when it did it's thingy?

Also I need clarification on the whole cookie thingy... The one in the basepage... Do I set that when I install my prog? And it's 8 bytes right? 4 for ident and 4 for address right? and the first four are for WHAT? and the second four is WHAT address? The original address that the vector I robbed points to? If my prog were to crash would TOS take that address and poke it back into the vector I robbed?

(here I catch my breath...)

Thanks,

Luke.

Does this include info on how to write your own drivers?

I was thinking it would be nice to write an HPLJ driver which lets
you set the resolution and paper type via the extendable control
panel (puts a structure address for these parameters in a cookie).
Right now you need a different driver for each resolution & paper
type.

d > continue adding or subtracting 1 from the object number until
d > all the objects have been checked.

form_keybd() takes care of all that. This is how I do it ("start"
is the index of the object being editted):

```
 if(flags & MU_KEYBD) {
  key = event.ev_mkreturn;
  wind_update(BEG_UPDATE);
  if(!form_keybd(tree, start, 1, key, &obj, &new)) {
   if(start) objc_edit(tree, start, 0, &cursor, ED_END);
   wind_update(END_UPDATE);
   return(obj);
   }
  if(obj) {
   if(!new) {
    objc_edit(tree, start, 0, &cursor, ED_END);
    objc_edit(tree, obj, 0, &cursor, ED_INIT);
    start = obj;
    }
   else objc_edit(tree, start, new, &cursor, ED_CHAR);
   }
```

Organization: Universite Paris-Sud, France.
Newsgroups: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platforms such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN, STonX and MAGIC MAC/PC.
There may be remaining incompatibilities that I wish users to
tell me about. So don't hesitate to mail me ...
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcome ...
Have fun with my production, bye for now ...

Hi all,
   I need to get hold of an assembler and a disassembler for use on my Atari STE 2meg Tos. Does anyone know of a shareware one that I can download from somewhere. Also it would help a lot if there was some sort of manual available. Thanks.

Dan Jones.

I believe Ease supports the AV Protocol, so you could use this. I'm not sure where the documentation can be found, but I can email it to you if you wish.

Where OH where can I find a Line drawing (graphics) vector font for the
Atari???? I DON't mean an ANSI set with 128-255 having IBM graphics chars.
I mean a separate font with line drawing chars in place of the lower case
alphabet, that is called by ss2 (^n) and ss3 (^o) by graphics calls in a
VT102 terminal. If I can't find one for the Atari, what other publicly
available fonts (TrueType???) can I use, and where can I find them???
     HEEEELP!

I would not recommend MASS; it's just the bits they missed out of the
lattice C documentation, The Compendium has it integrated with the existing
calls, and also has much more detail on everything.

Yes, it's very difficult for a C compiler to use things like circular
buffers or hardware looping efficiently. Many DSP vendors sell compilers
that use a C-like language with extra features for efficient DSP use; there
was some talk of standardising them but at the moment all such compilers
are different, and in any case none of them are freeware or available at
all for the Atari.

He's right about the ~; where the @ is used is to clear the text field - you
fill it with enough spaces (or anything else for that matter) and then go
back and replace the first one with a @.

tape-XDD surely?

With a small program (tape*) you can "mount" the tape and use
> something like...
>
> tar cvf * /dev/mt

The /dev/mt goes before the filenames, but otherwise that's about right.

Ouch. Do you mean the pins in the high density connector? I can imagine
they'd be easy to break.

Tom,

You may want to find 6502 Assembler for Atari's, its a very good book

and probably has examples in it. Place a posting for the book, you sure
to get it.

Curt

Thanks for the help but (after 3 hours of looking at my code)
I finally found the problem. I won't say just what it was as it
would make me seem as if I had an IQ of about 10 if I did say what
the problem was :)

BTW Johan I do actually find GEM programming in assembly fun!

I use form_keybd() in my GEM library in the way you mention (with multiple
windowed dialogues) and it works without any problems. Strangely, it worked
perfectly first-time and I've never had any problems.

So it definitely is possible. It also a better way to do it since you still
get the advantages of things like Let 'em Fly. If you write your own
form_keybd, such advantages are lost.

The 68k has a 32-bit ALU and 32-bit registers. It is, in fact, a 32-bit
processor; it just has a 16-bit bus to make the external circuitry cheaper.
In this respect it is equivalent to the 386SX.

The natural word size, then, is of course 32 bits. I don't know why most
Atari C compilers default to 16 bit ints.

JK>Does this include info on how to write your own drivers?

No.

JK>I was thinking it would be nice to write an HPLJ driver which lets you
JK>set the resolution and paper type via the extendable control
JK>panel (puts a structure address for these parameters in a cookie).

The NVDI CPX lets you set these attributes. Why do you want to
use a cookie?

JK>Right now you need a different driver for each resolution & paper type.

There is a message PRN_CHANGED which is sent from the NVDI driver CPX
to all running applications whenever the user changes the driver
settings.

And you should take a look at the German NVDI programmer's guide.

The system extension WDIALOG provides a complete printing dialog.
If you use these routines you won't need the driver CPX any more.

bye, Thomas

That's because the 68000 has a 16 bit ALU. Working with 16 bit integers is faster, usually 2 clock cycles unless it's an register to register operation, then it takes 4 extra clockcyles. Secondly using 16 bit ints is faster because of the 16 bit bus.

When you use a 680x0 "move.w" (move word) instruction, it deals with 16 bits.

Considering that the 680x0 has instruction sizes for byte, world and long, and C uses char, int, and long, these correspond pretty well IMHO. If you went to 32-bit ints, that would mean sizeof(int)==sizeof(long), which is not as flexible. There would be no way to specify a data type 16 bits wide without using a union or struct.

Eh? What's wrong with 'short'? (or 'short int'?)

Lattice C, for instance, has the basic types char, short and long,
and 'int' is either 'short int' or 'long int' depending on the compiler
options. Thus you can set the exact size if necessary, and just use 'int'
if it doesn't matter.

Regarding the "natural" word size, I might add that the 68030 still
requires instructions and the stack pointer to be aligned to word
(16 bit) boundaries, and that nothing is required to be aligned to
long boundaries (except the video RAM, but that's another chip).

I only use "int" for two reasons:

1) It's easier to type than "short".
2) All of my system header prototypes use "int".

Perhaps I should have avoided using int altogether. Then again,
sizeof(short) and sizeof(long) aren't carved in stone either.

It turned out that a couple of variables didn't get set properly within
my dialog callback stuff. Everything (almost) is fine now.

>perfectly first-time and I've never had any problems.

:-)
It was that way with my simple windowed dialog code, but there were just
too many small changes to do to make everything deal with multiple
dialogs.

>So it definitely is possible. It also a better way to do it since you still
>get the advantages of things like Let 'em Fly. If you write your own
>form_keybd, such advantages are lost.

Exactly. That's why I didn't even want to write windowed dialogs before.

I've developed a hardware system which runs a Motorola 68340 CPU and have been doing all my development for it with my Atari ST and the Pure C environment. This is all fine and grand but the end users of the product will be writing programs for it as well and do not own any Atari's.

What do I have to do to furnish them with a ready to run PC version of GNU configured for 68020 output in standard Atari .PRG files?

I would have expected that MagiC would have a "bring this app to the top" function, which would be a much nicer way to do than topping Ease's window.

I'll send the AV-Protocol documentation that I have by email since it's quite large.

Wow! I always know 68k processors were powerful - this just goes to prove it.

A "move world" instruction - something those loudmouth wimps at Intel don't have!

{[:-)]

<serious>
Yes, I know you meant "word".

I can't say; all I know is that the version that came with my copy of NVDI 4.11 ET4000 is virtually non-functional under Geneva. OK, I just checked, and it's version 1.04, according the message embedded in the program binary. That might explain a lot. Where can I get the newest (and hopefully most compatible) version?

Thanks...

From my limited lurking time here, I haven't seen any GFA people, but what the hey,
let me give this a shot...actually this may be more of a TOS than a GFA issue.

My program's main loop needs to look for keyboard & mouse events. With the
mouse, I need to select & highlight small pieces of the screen (I'm in ST high rez). I
was using the GFA calls MOUSEX, MOUSEY, and MOUSEK to read the mouse location
and button states. Then I learned that these calls use Line-A, and I should replace
them with AES calls. GFA 3.5 does the graf_mkstate function so I thought I'd go with
that.

The problem is that this call doesn't seem to work if the mouse is near the top of the
screen. I suspect that it has to do with conflicts with the menu bar, except that my
program doesn't use a menu (it needs the whole screen). Is there something I'm
missing? I'm not that knowledgeable regarding GEM stuff, having mostly
programmed stuff for myself (so I really only cared if it worked on MY ST <g>). It
would be nice to make my program more "legal" so I'd like to try and work this out
(who knows, maybe two other people would be able to make use of my program
<g>!).

Is it possible to #define int to something else? I know that gcc supports the -mshort option to force short ints (the default is long ints on the version I use).

Just a though.

Cheers,

James Cox.

hi,

I have a little problem with the DSP.

I need for my MONOTACHE soft, to reserve the entire 16ko in x and y.

but the system seems to have already set something in, because it
doesn't declare me all the 16ko (using Dsp_Available(...))

I tried to take all the memory with a little loading dsp code

All is working, but after the end of my soft, a new call to the function
DspLoadProg() made by any other soft (even mine) set the computer in an
infinite loop and i have to reset the computer.

So,

-I would like to know if the sytem has some vital information in the dsp

(memory x and y in the 16 external ko)

-How to reconfigure the system to make it run after the dsp mnemonic
RESET?

-If some vital informations are let in the DSP memory (idem as above)
could the function Dsp_execBoot() set the computer as if it has just
boot?

-if yes, did it exist in the system an runable dsp code to boot with ?
(needed by DspExecBoot())

-In fact i try to use the dsp, in any of it's precedent state, and the
reset it to make it work again with other programms

Thank you

Does anybody know where to get some *free* 68030 Assembler
for Falcon?

This is due to that the last part of the program memory, which is mapped on the last part of the X memory in Falcon, is used for a program uploader, which is used by DspLoadProg() and similar functions to upload your dsp code. So, if you in your dsp code overwrite this uploadcode, the next time you call DspLoadProg(), it won't be able to upload the program, and in the stupid way the function is made, it will hang the computer in an infinite loop trying to upload.

I don't know a way to really reset the DSP so that it restores the bootstrap uploader code I was talking about above. Obviously there is a way, since a reset of the computer does it, but the risk is that it's made by hardware.
If anyone else knows, I would very much like to know too. It would definitely help me when using the DSP in linux.

Tomas

I dunno GFA but a couple of points to consider ...

I'm not sure you should be using graf_mkstate() within the menubar.
The AES is aware of the desktop so it could be confusing it. Maybe you
can but someone else would have to verify this. I'd guess you'd at
least have to lock the screen. Might even have to install a dummy
menubar of your own even.

Anyway, the VDI might be a better choice. This is below the AES and
will definately be able to process a full screen.

>I'm not that knowledgeable regarding GEM stuff, having mostly
>programmed stuff for myself (so I really only cared if it worked on MY
>ST <g>).

A more theoretical point ...

If you encroach into the menubar then you will have problems with
systems like MagiC where the menubar is constantly being switched to
the active application. In situations like this you would need to have
your program installed as singletasking.

>It would be nice to make my program more "legal" so I'd like to try
>and work this out

Another thing with graf_mkstate() is that I have found it to be quirky

(I forget the AES version but it was either tos 1.2 or tos 1.2). I've
formed the impression (ie gut feeling) it lies at a level midway
between the aes and vdi.

>(who knows, maybe two other people would be able to make use of my
>program <g>!).

> evnt_multi()-loop while the parent does the same?

They can, but there are problems: firstly, each thread needs to call appl_init() etc, just as the parent process needed to; and secondly, if you're using C, then the chances are that you will have to re-write the libraries for AES/VDI access since all of the arrays are held in global variables, and each thred needs to have it's own set of GEM arrays otherwise the moment any of the threads happen to make a GEM call at approximately the same time things will go haywire!

I believe that there is a library somewhere out there that gets around this problem, but I don't know where, or who it's written by.

Cheers,

James Cox.

Thanks for the tip. I tried using the VDI, but it is slow, slow, slow!
My loop is contantly querying the mouse location and button state, and
even when compiled, the mouse pointer flickers badly! Now, I might be
doing something wrong here, as I only half-understand the concepts
involved, but I'm using the VDI function vq_mouse(). Naturally, GFA has
its own syntax for accessing the VDI, but I think I did it right: First
I got the screen's workstation handle with graf_handle(). The Atari
Compendium also says something about a "device id" but I assume that GFA
handles this internally?? Anyway, I put the opcode for the function
(124) in contrl(0), set contrl(1) and contrl(3) to 0, and put the handle
into contrl(6)--all this is from the Compendium, and GFA has
corresponding arrays pre-defined. In my loop, I read the contents of
ptsout(0) and ptsout(1) [the mouse x & y coordinates] and intout(0)
[button state], and it does seem to work; the numbers returned are
correct, it's just that this is very slow.

I do appreciate your taking the time to help out...right now it does
look like I'll have to go back to the old line-a GFA calls though.
Well, I tried!

I have two questions:

1) Does anybode know why programs in the AUTO folder do not have access to environment variables during start-up? Is there a way to circumvent the problem?

2) I have written a little program which sets daylight saving time automatically (and vice-versa). It runs OK in the AUTO folder, but it messes things up when executed by MiNT. Are there special requirements for programs if you want to have them executed by MiNT?

Thasks in advance.

Hello!

GETMPB is, as far as I know, useless with anything than Tos, isn't that correct?
Well, how do I find the MPB under MultiTos and MagiC? And how is the struct of that thing? Is it similar to the one under Tos?

Atari compendium says that GETMPB is useless under Mint, and it looks like it's useless under MagiC too.
Any help would be greatly appreciated!

Best regards
Geir...

Could this be the cause of the MagiC problem. Where sometimes, a call to the DSP (via the Brainstorm decoder) hangs the system. The only solution to this is to reboot the Falcon and it seems to go away (although sometimes a couple of reboots are needed)?

IIRC, GEM is not up yet. So when GEM comes up, it creates new environment variables.

It's interesting about what you are doing for DST. Is there an algorithm which can calculate the beginnin & ending of DST? I am looking for one to put into my world clock, called PH World Clock. Currently my clock handles it quite simply by having the user tell it that DST is on.

MagiC supports almost all the MiNT function calls (as of V5). Even V4 supported
quite a lot of them, and Dpathconf() was among them.

> In other words, can you have a drive U:? I see from someone with MagiCPC that
> there is a U: drive but is it like MiNT's U:?

Pdomain() just causes MagiC's file selector (and any loadable filesystems
present) to assume that the program understands long filenames (this is a V5
feature). Dopendir()/Dreaddir() work fine as of V4.

Hi All!

First some bad news. KillThings (Doom clone) is no longer being developed by DigiTallis (Boo hoo! :(

Some Good news. The source code and executables are now on the DigiTallis Web site as PD! :)

I have down loaded it and I think I might be able to finish the coding! (Just got to define a level file spec, put in level loading routs, add game logic, finish off the level editor, etc, etc. A big job, but once I define the level specs, then It should be a lot easier. Tell you what though, perhaps some other programmers out there would like to lend a hand? If we can define a common level file format, then we can all work together to get the game finished!)

Yeah!

Bye for now!

Brian!

Apart from scanning the ASSIGN.SYS file looking for *.SYS files and appropriate driver numbers, or looping through 1-99 and trying to v_opnwk() and seeing if handles are viable, is there another, simpler way I can find out what GDOS drivers are available to the system?

for STiK. In my dialog box, where I get the host ID from,
It comes up fine with
"Host:_____" , BUT The cursor in the dialog box
is at the end of the line, not at the beginning, like it should.
Thus, one has to hit <esc> to clear the line and enter the data.
What am I doing wrong? I am using Lattice 'C' v5.6.
Please, This is my first real 'C' project, and I am not yet
too familiar with the lingo or with WERCS. so please reply elaborately.
Thanx in advance.

In a attempt to kill the dread BUS ERROR (2 bombs) I am thinking about
a method to intercept exception vector 2 and replace it with my
routine that just ignores the exception. I tried signal()s, but they
won't catch it.

```
Setexc( 2, (void (*)())-1) will read the current vector.
Setexc( 2, trap_ex)        should set it to function  trap_ex()
```

and of course, reset it before I return.

Question:

```
void __interrupt trap_ex()
{
}        will this work?
```

or:

```
void trap_ex()
{
     _emit( RTE );
}
```

or should I just suffer with the BUS ERRORS?

Well, you could read/write complete tracks from a disk. It does not matter how
the disk is formatted then.

Hi,

Can anyone point out some information sources which detail specific Falcon features such as new xbios, AES calls and DSP programming.

Is there any free DSP 56000 compiler available?

Thanks

Get the book Modern Atari System Software, or The Atari Compendium.
Alternatively, get the osbind.h and xbios.h etc. from an up-to-date
C compiler for the prototypes...

Also, check out my WWW pages, as I have information on how you use
some of the new calls...

>Is there any free DSP 56000 compiler available?

Yes, Micro C and GCC have both been ported to generate 56000 code.
(sorry, I dont know where you can get either compiler on the net)
However, according to Doug Little, a C compiler will generate far
from optimal 56k code, and it would often be better just to use the
680x0 (but this is not the case with hand-written 56k code).

Anthony

The Atari Compendium would be a good start (as usuall...). It covers about
everything and all AES calls up to AES 4.1 (which is the latest) including
xbios and some DSP stuff.

> Is there any free DSP 56000 compiler available?

I think Motorolas DSP assembler is for free (and the best I think), or?

It's quite simple; you have, presumably, filled the text string with
"_" characters. This is not necessary. All you have to do is start
with the p_text field blank (i.e. wherever you put "_", delete them).
The p_tmplt field should contain (in WERCS and all other RCSs that
I've seen) "Host:~~~~~~~~~~" (as many "~" as you need). The other
field should have "x"s (as many as you have "~") and nothing else.
(I may have got the p_tmplt and the other field mixed-up; in any
case I can't remember the name of the second one).

The font header is the same as the one in Lattice C's "linea.h" header
file.
It is exactly the same thing.

Yes. Convert the file into hex codes; then (if you want to use the
line-A) to
plot the font, you'll have to mess with the textblt function. It's very
gory
and really quite awkward. Instead, I suggest you load the font from
ASSIGN.SYS.
(And use GDOS).

> that are ignored and obliterated once the init() code is finished...

work_in[] is an array containing the default attributes for each of
the drawing functions (e.g. colour, size, etc...). I don't recall which
way round they go (but you should be able to test this easily enough).

work_out[] is a 57 element array (normally), which gives you information
about the particular display device you have chosen to draw upon. Again,
I don't remember all the elements... but you should get a Compendium or
something to look them up in.

MB>is there another, simpler way I can find out what GDOS drivers are
MB>available to the system?

There are two VDI calls, both are supported from NVDI 3.00 onwards.
vq_devinfo() is also available in SpeedoGDOS IMHO, but the use of
vq_ext_devinfo() is recommended.

----------schnipp----------

 INQUIRE DEVICE STATUS INFORMATION (VDI 248)

vq_devinfo() returns if a driver is available and if it has been opened
already. The file name (e.g. "XVGA256.SYS") and the full name ("VGA 256
colors") are returned, too. If the file name is empty, the driver is
not available.

```
Decl.:  void  vq_devinfo( WORD handle, WORD device, WORD *dev_open,
                          BYTE *file_name, BYTE *device_name );
Call:   vq_devinfo( handle, device, &dev_open, file_name, device_name );
```

Input:

```
contrl[0]        248                 vq_devinfo
contrl[1]        0                   # ptsin
contrl[3]        1                   # intin
contrl[6]        handle
intin[0]         device              VDI device (0-99)
```

Output:

```
contrl[2]        p                   # WORDS in ptsout
contrl[4]        i                   # words in intout

ptsout[0]        dev_open            0: driver has not been opened yet
                                     1: driver has already been opened
ptsout[1..p-1]   device_name         driver's full name (C string)
intout[0..i-1]   file_name           driver's file name
```

Annotations:
The file name is returned word by word, i.e. for each letter one word
is used (control[4] returns the length of the string). The full name
is returned as a ASCIIZ string (control[2] returns the number of
WORDS in ptsout).

----------schnipp----------

 INQUIRE EXTENDED DEVICE STATUS INFORMATION (VDI 248, 4242)

Like vq_devinfo() vq_ext_devinfo() returns the driver names and information. Unlike, the data format makes more sense.

```
Decl.:  WORD  vq_ext_devinfo( WORD handle, WORD device, WORD *dev_exists,
                              BYTE *file_path, BYTE *file_name, BYTE *name );

Call: dev_open = vq_ext_devinfo( handle, device, &dev_exists, file_path,
                                 file_name, name );
```

Input:

```
contrl[0]        248                vq_devinfo
contrl[1]        0                  # ptsin
contrl[3]        7                  # intin
contrl[5]        4242               subopcode
contrl[6]        handle
intin[0]         device             VDI device (0-99)
intin[1/2]       file_path          pointer to file path buffer
intin[3/4]       file_name          pointer to file name buffer
intin[5/6]       name               pointer to full name buffer
```

Output:

```
contrl[2]        0                  # ptsout
contrl[4]        2                  # intout
intout[0]        dev_exists         0: no driver with this device number
                                    != 0: driver exists
intout[1]:       dev_open           0: driver has not been opened yet
                                    != 0: driver has already been opened
```

All returned strings are C-like ASCIIZ string.

----------schnipp----------

I believe MiNTNet has a driver for that card, so you should be able to use
CAB with it via MiNTNet.

Has anyone ever seen any DLLs for the Atari?

Or know of any programs that use them?

I have been working on a TSR that allows the loading of modules and "DLL"
like extensions or plug-ins. It will be released later this year, and will
be freely distributable (within reason).

(More details will be forthcoming - I am still debugging the Load/Free
funcs, as well as make it somewhat more "intelligent")

> the Falcon.

Footnote to the above:

The 030 has a 32-bit CPU-to-world data path. The 386SX is only 16 bit in
this regard (the 386DX is a full 32/32 CPU like the 030).

The '020 and '030 have a feature called "Dynamic Bus Sizing" whereby the
CPU detects the bus size on each access. It can be used on either a 16 or
32 bit system board. A 16-bit system board (like that in the Falcon) is
slower than a same speed 32 bit system board (like that in the TT)

The '040 removed this feature. It can be added, however, by the addition
of an external Motorola 68xxx chip - I forget the chip number, but it's
mentioned in the comp.sys.m68k FAQ.

Ok, If I could find the problems, I could fix them. But I get cryptic
messages that say "I got 2 bombs" and I have no idea where the problem
is. I need a method to detect and report the BUS Error so that I can
fix it!

More Ideas?

Get Templemon. It's free and should be available on the normal FTP sites.
(It may be abbreviated TEMPLMON.)

It sounds like your programming language has its own bomb handler, so you
may have to do this:

1. Run your program.
2. Press Control-Help (to get into Templemon)
3. Type "vi" to reinitialize Templemon's vectors.
4. Type "g" to Go back to your program.
5. Make it crash. You should end up back in Templemon.

Of course, now you'll need to know assembly language to actually figure
out where the error is...

A few. ;-)

Imo low level debugging is not much use. Just because your program
crashes at a particular point does not mean that point was at fault,
or under multitasking that your program is even at fault at all! Thus
I prefer to incorporate debugging into the program itself.

Leave in the all debugging information just in case the report comes from someone who happens to be proficient in the same language. Rare but useful.

As we all know many (most?) problems are down to memory leaks so it is well worth writing your own memory manager so you can implement decent checking. It could then output a suitable alert and dump that and the "arena" to disk before continuing onto the crash. The more checking the better. There's nothing stopping you storing function names in your custom block headers if you wanted. ;-)

Logging entry and exit from functions is another useful method but you must ensure the data gets written. I method I have used is loosely based on the below. More intelligence is needed of course but this serves to illustrate ...

```
debug(r)
char **r;
{FILE    *fp;

 if (!(fp = fopen("LOGGING",APPEND_ONLY_IF_EXISTS_MODE)))
     {
     /* logging disabled */
     return;
 }
 fprintf(fp,"%r",&r);
 fclose(fp);
}
```

.. which is going to be damn slow when enabled of course!
[I'm not sure if recursive printing is MWC specific or not]

As an aside, I thought telling people how to create a zero length "LOGGING" file to enable the logging would be easy but sometimes it was not, so supply a little program to do it for them! <G>

If you read Motorolas own documentaion they clearly write that the
68020 is the first 32-bit implementation of the 68k family of micro
processors.

I'm interested in using some C stuff in GFA. I;ve looked at one exa,ple program,
and its not clear quite how it works.

This is what I've gathered so far:

place the .o file of the C you want to use in the system folder before compile, you can then call the C procedure by using $X proc name.

what I'm not sure about is how I can pass parameters back and forth, and also how this works in interpreter mode.

Does anyone have any example progs (both C and GFA) explaining how to use it etc. ???

If so can they mail me a reply ??? (houghp6@cs.man.ac.uk) or reply here.

Thanks

Phil Hough

Newsgroups: comp.sys.atari.programmer

I've been using GFA Basic for many years and have done some pretty big-scale (to me, anyway!) projects with it. I'm a musician and have mostly written programs to help me get more from my gear.

My latest project is to help me use my Roland XP-50 keyboard, and it requires me doing something I've never done before, in all my years of programming--a dialog box! I've always used GFA's own keywords & commands to take care of system calls, and they don't have a specific DIALOG command similar to ALERT (for an alert box).

Anyway, I'm completely self-taught and have gotten a lot of help from

many people over the years when I needed it. I have a book on TOS and have gotten into things that I needed to, like re-sizing the midi buffer, messing with disk files, etc. However, I've never had to write my own AES, VDI, or higher-level GEM routines because I've been able to accomplish those things with GFA's own commands. Do you see the problem? I am completely lost when I try to get into these areas because all the books & tutorials I've seen assume knowledge of C, assembler, and microprocessor workings. GFA shields me from all that (like a good BASIC should, I suppose!), so I never learned what is going on at the nuts & bolts level.

I have Tim Oren's old PROGEM series, and the Atari Compendium. Re dialogs, I understand the basic concept of parent-child object trees but get lost when trying to figure out the syntax--how to put together the TEDINFO, etc. stuff and make it work in my program. The example files that came with GFA 3.5 don't help me much. I would like to know if there is any reference material that would help someone like me who is not new to programming in general (ie, I have the capacity to understand some advanced topics) but need to start from the point *before* someone already experienced in C and assembler. I have searched the web and not found much...any help is appreciated. Thanks!

Rob Aries

: >Fix your programs. Bus errors are the result of bugs.

: Ok, If I could find the problems, I could fix them....[snip]

Definitely fix your programs -- bus errors are caused by attempting to access (read or write) memory you are not allowed to. For example, attempting to access an OS variable without being in supervisor state. Reading or writing outside of the total mapped memory, or attempting to write to ROM areas.

: More Ideas?

One way to try and catch the point where is bombs out is to use MiNT with memory protection on. This will distinguish between reading/writing to memory like OS variables (bus error) and just accessing memory outside of your program (perhaps accidentally reading/writing after then end of an array, particularly if that array was createde with Malloc().

MiNT should give you a message telling you the type of the error (bus/address etc) and the point in your program where it happened. The trick then is to figure out the point in your program exactly -- if you are writing in assembly then this is a doddle, but anything else is a bigger problem.

Hope some of this is of some help.

Cheers,

James Cox.

Has anyone ever seen any DLLs for the Atari?

Or know of any programs that use them?

I have been working on a TSR that allows the loading of modules and "DLL" like extensions or plug-ins. It will be released later this year, and will be freely distributable (within reason).

(More details will be forthcoming - I am still debugging the Load/Free funcs, as well as make it somewhat more "intelligent")

Shared libraries are really only useful in a multitasking environment, otherwise only a single process would ever use them at a time anyway. Of course there are benefits of being able to fix bugs without re-linking the executable.

You may want to look at MiNT--it may have support for shared libs.

Also, shared libs, if not implemented correctly, may cause problems in a multitasking environment with memory protection between processes. Generally, shared lib code will reside in "shared, read-only executable" memory space.

Yes, of course. Andreas has written a reentrant AES library for MagiC.
If you run MagiC, you can download it from the ASH BBS.

Cheers Peter

Try to set the first character of the tedinfo te_ptext field to a '@' :

```
   tree[index].ob_spec.tedinfo->te_ptext[0] = '@';
```

Cheers Peter

With STiK 2 you'll be able to use a Ethernet module that provides
Ethernet connectivity for STiK. However, it's not ready yet ... ;-)

>DIALOG command similar to ALERT (for an alert box).

Get hold of a resource editor. You just place the "OBJECTS" where you
want them and it builds it for you (the .rsc file). Don't do it by
hand. I've been doing them for years and still screw it up if I have
to do one manually! Plus, manual ones are a real pita to change.

Can somebody recommend a shareware editor?

The only resource editor (I know of) which generates GFA is Interface
which is commercial. Don't let that worry you though. It is easy to
convert the C header file (the .h one the editor writes) into (I guess)
an .lst file. Certainly infinitely easier than doing the whole lot
manually anyway!

>Anyway, I'm completely self-taught and have gotten a lot of help from
>many people over the years when I needed it. I have a book on TOS and

>accomplish those things with GFA's own commands.

Another advantage to using a resource file is that it has the
potential to be resolution independant. The rsrc_load() function does
the conversion for you.

>Do you see the problem? I am completely lost when I try to get into these areas
>because all the books & tutorials I've seen assume knowledge of C,
>assembler, and microprocessor workings.

Assuming you use a rsc editor and that GFA has such commands as
rsrc_load() etc then most of your subsequent problems will revolve
round accessing the relevent bits of data in the resource.

A rsc is built from OBJECTs and array of OBJECTs make up a TREE. One
of the things a TREE can be is a dialogue box.

No doubt you'll have come across something like this already ...

```
typedef struct object
{
     int      ob_next;  /* -> object's next sibling */
     int      ob_head;  /* -> head of object's children */
     int      ob_tail;  /* -> tail of object's children */
     unsigned int  ob_type;  /* type of object- BOX, CHAR,...*/
     unsigned int  ob_flags; /* flags           */
     unsigned int  ob_state; /* state- SELECTED, OPEN, ...
     */
     unsigned long ob_spec;  /* "out"- -> anything else  */
     int      ob_x;         /* upper left corner of object
     */
     int      ob_y;         /* upper left corner of object
     */
     int      ob_width; /* width of obj             */
     int      ob_height;    /* height of obj       */
} OBJECT;
```

It translates thus ...

Decimal offset	Name
00	ob_next
02	ob_head
04	ob_tail
06	ob_type
08	ob_flags
10	ob_state
12	ob_spec
16	ob_x
18	ob_y
20	ob_width
22	ob_height

So, if you had a variable P then to read the value of ob_x you would
need to get 2 bytes from p+16 - something like PEEKWORD(p+16) I suppose.
ob_spec is the only 4 byte value and is used differently depending on
the OBJECT's type (ob_type).

The OBJECT structure is always 24 bytes long as you can see, and because a TREE consists of an array of these then you need to be able to access the correct array element. In C you are not limited to having arrays of strings or integers - you can make up your own things, so when you see ...

```
OBJECT   P[10];
```

.. you have declared 10 lots of 24 bytes, and when you see this P[3] written in C, it is the same as saying P+(24*3). Combine this with the ob_x part above then P[3].ob_x in C translates to P+(24*3)+16. Thus for any C array reference to a structure ...

```
                    P             24               3             16
mem_location = base_address + structure_size * array_element + offset
```

Just write some functions to do this sort of thing for you 'cos the potential for errors is enormous!

>GFA shields me from all that (like a good BASIC should, I suppose!),
>so I never learned what is going on at the nuts & bolts level.

A dialog box consists of a ROOT OBJECT which is covered by CHILDren. The ROOT OBJECT is always in the array at element 0. The CHILDren reside in other elements in no particular order (the ob_next, ob_tail, ob_head items define their relationships). The resource editor does this for you, you'll be pleased to hear. This is where the C header file (.h) comes in. It allows you to name any OBJECT you want to mess with. When you save, it assigns the correct array index values to the names so that you can access the OBJECT you want. Note - each time you save in the editor, these values can and will change so never put fixed values in your program - always use the names.

The C header will look something like this ...

```
#define  F0       0    /* TREE in Resource {filename} */
#define  F0OK     7    /* OBJECT in TREE F0 */
#define  F0CANCEL 3    /* OBJECT in TREE F0 */
```

This needs to be translated into something like this ...

```
LET F0 = 0
LET F0OK = 7
LET F0CANCEL = 3
```

.. it's that simple!

So your program would like something like this ...

```
R_TREE = erm_dunno_offhand
ROOT = 0
MAX_DEPTH = 8
```

```
RSRC_LOAD("eg.rsc")
RSRC_GADDR(R_TREE,F0,&P)
FORM_CENTER(P,&X,&Y,&W,&H)
FORM_DIAL(0,1,1,1,1,X,Y,W,H)
OBJC_DRAW(P,ROOT,MAX_DEPTH,X,Y,W,H)
RESULT = FORM_DO(P,0)
FORM_DIAL(3,1,1,1,1,X,Y,W,H)
RSRC_FREE()
```

.. where P is a 32 bit value so it can hold the TREE (ie the base address of the OBJECT array). R_TREE, ROOT and MAX_DEPTH are constants commonly defined when using Gem. Where I've used the & above you need to find some way of passing the address of the variable rather than the variable itself, so that the functions can fill those variables with the correct values. The above does nothing except display and get rid of the dialog to keep it simple.

>I have Tim Oren's old PROGEM series, and the Atari Compendium. Re
>dialogs, I understand the basic concept of parent-child object trees but
>get lost when trying to figure out the syntax--how to put together the
>TEDINFO, etc. stuff and make it work in my program.

TEDINFO is one of those things which is slung onto the side of an OBJECT. This is the sort of thing that ob_spec is used for.

```
typedef struct text_edinfo
{
     unsigned char *    te_ptext; /* ptr to text (must be 1st)
     */
     unsigned char *    te_ptmplt;    /* ptr to template
     */
     unsigned char *    te_pvalid;    /* ptr to validation chrs.
     */
     int      te_font;  /* font                */
     int      te_junk1; /* junk word           */
     int      te_just;  /* justification- left, right...*/
     int      te_color; /* color information word   */
     int      te_junk2; /* junk word           */
     int      te_thickness; /* border thickness         */
     int      te_txtlen;    /* length of text string    */
     int      te_tmplen;    /* length of template string
     */
} TEDINFO;
```

```
Dec offset
----------
00       te_ptext
04       te_ptmplt
08       te_pvalid
12       te_font
14       te_junk1
16       te_just
18       te_color
```

```
20       te_junk2
22       te_thickness
24       te_txtlen
26       te_tmplen
```

If there was a TEDINFO in the OBJECT named F0EDIT then it is accessed thus ...

```
T = PEEKLONG(P+(F0EDIT*24)+12)
```

. then you could manipulate it ...

```
S = PEEKLONG(T+8)
```

.. which leaves S pointing at the nul terminated te_valid string.

> The example files that came with GFA 3.5 don't help me much.

There is a utility called MYDIALS for GFA which I think places whole dialogs into windows. Although this is more than you want it might have some tools or sources which will help you figure out how to translate all the C examples into basic.

>I would like to know if there is any reference material that would
>help someone like me who is not new to programming in general (ie, I
>have the capacity to understand some advanced topics) but need to
>start from the point *before* someone already experienced in C and

Try initializing the string tedinfo->te_ptext points to. So, if you
have

```
  string[number];
```

initialize it with

```
  string[number]="";
```

or

```
  string[number];
  string[0]='\0';
```

Yes, but I don't think you should look at the above as shared libraries
in the normal sense. DLL, after all, stands for Demand Loaded Library.
That is, a library that is only loaded when it's needed. It doesn't
necessarily have to be sharable by definition.

IMO this would be a generalized way of dealing with for example load/save
modules in image or word processing programs.
If it's released soon enough, I'll definitely consider using it for the
module system that will go into the next version of MGIF. Otherwise I'd
have to write something similar myself.

>Of course there are benefits of being able to fix bugs without re-linking
>the executable.

Perhaps, but for that to be really useful your executable would, IMHO, need
to be partitioned into relatively small 'library chunks'.
It's after all not that often that serious bugs are found in the standard
libraries themselves.

Unfortunately not. That's one of the things that gets suggested about every six months or so on the MiNT mailing list; usually, it gets as far as determining that it will require modification to the compiler to generate the shared library and stub calls thereto before petering out.

I'm currently writing a replacement form_do() so that I can use non-modal dialog boxes.

I am having a little problem with editable fields though.

My routine works fine if all the editable fields are either: in one child object, in one child and the root object, or if they are all in the root object.

The problem arises when I have editable fields in two seperate child objects. When I try to move the cursor between the two child objects it crashes on me.

My cursor routines add or subtract 1 from the object number, check to see if the editable flag is set on this object, if it is then I place the cursor in to the object otherwise I continue adding or subtracting 1 from the object number until all the objects have been checked.

Can anyone help?

(And before anyone says to just use a C library that already supports

non-modal dialog boxes I'm writing in assembly language)

a TSR approach to this under MiNT is a _bad_ move. Causes all sorts of
problems. Also, you can't load and unload modules on the fly. Fine if you
intending this to be used for SingleTOS without MiNT (TOS in ROM, basically),
but if you want this to work with MiNT then you'll need a big redesign.

: Shared libraries are really only useful in a multitasking environment,
: otherwise only a single process would ever use them at a time anyway.
: Of course there are benefits of being able to fix bugs without re-linking
: the executable.

: You may want to look at MiNT--it may have support for shared libs.

It doesn't as far as I know.

: Also, shared libs, if not implemented correctly, may cause problems in

: a multitasking environment with memory protection between processes.

Exactly.

: Generally, shared lib code will reside in "shared, read-only executable"
: memory space.

I would argue that a shared library/module/whatever who _always_ be in shared, read-only memory. Anything that the module wants to be able to change should always belong to the client application.

Incidentally, I am working on a Component Manager for MiNT (and only MiNT -- it won't work without multitasking support). I have no idea when it will be finished, but I'm hoping that I will have a little time in about 13 weeks (when I finish my degree -- wayhay!! :). It's all designed, and partially coded -- I just need time to sit and code the rest.

Cheers,

James Cox.

Or, if you are MS-brained, DLL = "Dynamic(ally) Loaded Library".

Either way, it amounts to (almost) the same thing.

My TSR is called "The Toolbox", and I've been working on it since 1992.
It became extensible in 1994, and the ability to dynamically load a module
was added quite recently (previously all modules could only be loaded at
boot time).

It was originally designed as an OS-level library of callable code,
then it became a library manager.

It was all written in assembly language, using Devpac 1.25 (from an ST
User cover disc) and now Devpac 3.1 (from Hisoft)

At present, there are some bookkeeping problems with using it in a multitasking environment (primarily when multiple apps are using one dynamically loaded extension). It works OK under MTOS with memory protection.

It requires TOS 1.0 or better, and about 32k of RAM. It works best when loaded before MiNT, and was designed for the GEMDOS file system, although it works moderately well when using minix file system under Mint.

I've designed it to have only one instance of any particular extension (based upon a "cookie" identifier within the extensions ID block).

I'm torturing the current version - as well as mulling over the exact format of the extension/toolbox interface. The "calling the extension" is fully working, but the extension ID block needs work.

There is a built-in limit of 16 extensions loaded simultaneously - but this limit will be raised soon.

It lacks RPC functionality, though. I'd like to add that later.

It still has an assembler level interface in terms of the startup code, and I haven't tried to make it "Lattice Friendly", so you can write extensions in a higher level code (you'd need to make a few changes to the startup stubs and initialisation code, as well as setting the base register [generally A4] on entry to any funcs that needed it when using a base-relative compiler mode).

If you are interested in taking this further, I'll start a "Toolbox API" thread in c.s.a.p and we can nut out the details to form an "open" standard calling protocol.

I am just learning how to program the Atari 400/800 in assembly and
would like to get a few examples of assembly programs for the Atari
400/800. I work best from examples. If anyone would be willing to
share a program or two it would be most helpful.

Thanks for any help on this

Tom

Hmm, if you always place the cursor in an editable field I can't see why
it would crash. Unless you put it there in the wrong way of course.

>Can anyone help?
>
>(And before anyone says to just use a C library that already supports
>non-modal dialog boxes I'm writing in assembly language)

There's nothing stopping you from using C libraries from assembler (if
you use a decent assembler), but I know it can be interesting to write your
own stuff from the ground up.
Still, writing GEM code in assembly doesn't sound like much fun at all.

Anyway, I actually modified the MGIF sources for windowed dialogs a couple
of days ago and extended that to handle any number of open dialogs
simultaneously only yesterday.
For the edit field things I simply used form_keybd(), which worked very
well for the single windowed dialogs (incredibly simple to do). There are
still some strange problems remaining with the multi-dialog version,
though, so I'm not 100% sure that form_keybd() actually does the job...
(There are lots of other strange things going on in the extended code, so

form_keybd() may well be blameless.)

Perhaps there's someone around who has more experience with form_keybd()?

Tricky blighters are editable fields. :-)

>My routine works fine if all the editable fields are either: in one
>child object, in one child and the root object, or if they are all
>in the root object.
>
>The problem arises when I have editable fields in two seperate

Check out objc_edit() carefully. There are two bindings for it and I'm
not sure offhand which is the "real" one.

objc_edit(tree,object,character,oldindex,kind,newindex)
objc_edit(tree,object,character,&index,kind)

. where &index does double duty (oldindex in - newindex out).

There are some instances where an incorrect LASTOB will cause Gem to barf (anywhere in the wrong place can make it sulk basically).

With that sorted, you use ED_INIT to start a text field, ED_CHAR within it, and ED_END to finish off the field. So to move fields you need an ED_END(cur_field) then ED_INIT(new_field).

>My cursor routines add or subtract 1 from the object number, check
>to see if the editable flag is set on this object, if it is then
>I place the cursor in to the object otherwise I continue adding or
>subtracting 1 from the object number until all the objects have
>been checked.

There are two concerns with this method, both are derived from the fact no consideration is given to the real order in which the objects in the tree occur. This has implications both for the LASTOB flag (which you are effectively ignoring) and which field the cursor appears in when you "tab" to the next one (which could differ between Gem and your routine). For a one-off situation this is acceptable as you can massage the resource editor into producing the order you want but not otherwise.

>Can anyone help?

You need to walk the tree like Gem. Gem does a recursive descent until it meets LASTOB (end of tree) or returns to the ROOT. A handy function to implement is one which does something like this ...

Objc_Walk(tree,startob,func)

. which descends 'tree' from 'startob' repeatedly calling 'func' until it rises back to 'startob' or 'func' aborts the traversal. 'startob' is typically set to ROOT but this code can be used for lots of things if 'func' is passed 'tree' and the index of the current object - like manipulating radio buttons for instance (ie - set 'startob' to the parent of the buttons, func unselects them .. blah).

>(And before anyone says to just use a C library that already supports
>non-modal dialog boxes I'm writing in assembly language)

Most C libraries behave like traps. You should only have to preserve d3-d7 and a3-a6 to make a call work, but it's more fun doing it yourself!

Build a version of GNU C which runs in a DOS or Windows PC environment and generates Atari 020 or higher code. To do this, you must first download the latest Gnu C sources. Take a look at the docs, they explain how to build a cross compiler. You must also try to get hold of a libgcc1.a file for atari (you could build it yourself with GCC on atari). And you must build a PC version of the atari binutils package (I haven't been able to get them to work on Linux yet. Good luck...) If you've done all this, then you _should_ be able to build a cross-compiler. Then all you have to do is create a suitable PC environment for compiling, and bingo! You've got yourself a cross-compiler... Theoretically...
A good place to start is the DJGPP distribution (a DOS version of GNU C) at Simtel (ftp.simtel.com or www.simtel.com or whatever...) and the MiNT patches for the GCC source (needed to create an Atari target. You should be able to get them at most Atari FTP sites. Try ftp.fu-berlin.de)

If you pull this off I would like to hear from you! (I've been trying for some time to set up a cross compiling environment under Linux. I failed...)

One reboot has always been enough for me, when such a problem occurs.
Although, I don't use MagiC. I haven't had this problem using Brainstorm's
decoder, but it may very well be this that causes it.
But it might also be if you have used another program which uses the DSP,
then the Brainstorm decoder is overwritten, and the program trying to use
it might hang, if it's not programmed with a timeout.

I have been browsing through the chapter about preprocessing in the best C-reference manual I know of, the second edition of Kernighan & Rithchie "The C programming language", and it doesnt say anything about redefining datatypes.

However, it says the following about datatype and sizes:

"The intent is that short and long should provide different lengths of integers where practical; int will normally be the natural size for a particular machine. short is often 16 bits, long 32 bits, and int either 16 or 32 bits. Each compiler is free to choose appropriate sizes for its own hardware, subject only to the restriction that shorts and ints are at least 16 bits, longs are at least 32 bits, and short is no longer than int, which is no longer than long."

Do a search on the HENSA site. I think there are a couple of good

assemblers to be found there.

Also, I believe there is a public domain version of Devpac, which was given away on a magazine cover disk years ago. Try to get hold of a copy of this as it is very good.

Hi everyone,

I forward this message for Doug Little. If anyone knows please answer me directly or post in this newsgroup. It's _very_ important.

Hi,

Does anyone out there know where I can find details on the Devpac GST linkable object format, or the Lattice Linkable format? I need 22-character linkable output from Devpac, so DRI isn't good enough.

Needless to say, it's not enough just to switch to another linker which supports these formats since I intend to link with GNU objects, and so need to write a utility for Devpac->GNU conversion. I already have GST2GNU.TTP, but it won't read Devpac GST binaries. The Devpac BIN format is completey different from the one accepted by GST2GNU (I don't know why). I have examined the GEN output and compared it with the header structures used in GST2GNU and they are not even vaguely similar.

Any help would be _very_ welcome.

Doug.

For all this, and much other information, I think the Atari Compendium is the best. It includes all neccessary things, I think. For the later AES versions, 4.0 and 4.1, I know there are textfiles about those, but I don't know where to get them, try ftp.uni-kl.de or ftp.cnam.fr

> furthermore i'd like to have an instruction set, programming &
> optimation guide to the DSP56001

The DSP56000/DSP56001 User's Manual by Motorola is very good to have. It has all things you need on how to program the DSP, but no Atari specific things obviously. It doesn't contain optimisation either.

About an assembler to use, a56.ttp isn't very good, I know, but unfortunately it's the only freeware DSP assembler available for Atari. There are at least two non-free assemblers too, DevpacDSP, which isn't very good at all but has a GEM shell, and Motorola's asm56000.ttp which is, IMO, the best. At least I think Motorola's assembler isn't freeware, I may be wrong. I know the sources aren't free.

I've started to write a series of pages on my homepage about programming the DSP on Atari. Unfortunetely, I've been too lazy and to busy at school to write more on it lately. The URL for it is
http://www.lysator.liu.se/~tobe/DSP/

Greetings,

Tomas

Then it's possible and legal, as it should be. In case anybody is
confused ...

The preprocessor does not form part of the 'C' language. The 'C'

compiler starts its work on the output the preprocessor produces - not
on the stuff you type in. ie all the "#" keyword stuff has gone.

Back in the good old days(?), a program could detect that it was running as an accessory, by checking a7 on entry to the program. If it's 0 then it's an .acc.

With multitasking (certainly multitos), this no longer holds true :(

What is the best way to see if you're an .acc or .prg under *all* TOS's?

TIA, Gary

It's written by Andreas Kromke, the programmer of MagiC, and can be found
in Application Systems Heidelberg's BBS (don't have the number here).

Cheers Peter

That is correct, but even more : It is useless even with TOS. Reason is
the call does things that confuse the internal memory management. It
really should not be used.

Apart from this, memory management is the most internal thing in any
operating system, and by far in most cases it is neither needed nor
advisable to interfere with it.

> Well, how do I find the MPB under MultiTos and MagiC? And how is the
> struct of that thing? Is it similar to the one under Tos?

MultiTOS uses the same scheme as MiNT, and that is AFAIK the same as the
TOS system. MagiC does it completely different.

> Atari compendium says that GETMPB is useless under Mint, and it looks like
> it's useless under MagiC too.

It's not useful anywhere.

Do not use VDI input functions if AES is active. Reason is AES will fetch part of the input, your application another part, neither of the parts having the complete information. As long as AES is active you must use the AES input functions, and for that, if you can tolerate busy waiting, graf_mkstate is just the perfect choice. I doubt that your problem was due to AES, in single TOS graf_mkstate should certainly work even in the area where normally the menu bar appears, if no menu bar is activated (via menu_bar(..., TRUE);). If you have a menu bar, however, then of course graf_mkstate should not work as usual if the mouse enters the menu bar. So if your graf_mkstate does not work at the top of the screen, even though you use single TOS and no menu bar, then I suspect strongly GFA does something strange about this.

Note that not allowing a menu bar, relying on single-TOS and busy waiting is not state-of-the-art programming anymore. Instead, use wind_get (0,...); to inquire about the screen area you may use (this already does exclude the menu bar !) and you won't have any problems with the top of the screen anymore (simply because you're not using it), and MagiC may put other application's menu bar there without any harm for your program. Next step is using evnt_multi(); or evnt_mouse(); for inquiring about the mouse parameters, this allows cooperative multitasking.

Cheers Peter

It is still the best way ! At least under MagiC a7 is not zero if started
later, even if the extension was *.ACC ! I guess it is the same with
MultiTOS ?

I found such a library, it's called MT_AES and is written by Andreas
Kromke. I haven't tried it yet, but according to the docs it should
work with MagiC (Of course...), MultiTOS and N.AES.

I found it on ftp.funet.fi/pub/atari/Newitems a couple of days ago.

Yes, and if you are using MiNT, its variables get created first, before those of the AES. Under MultiTOS and Geneva 005, the env vars specified in MINT.CNF get inherited by the AES.

As far as the AUTO folder goes, however, there's not much use in dealing with env vars. Even if you were to create some in the "parent" basepage of AUTO folder processes, they would go away as soon as either MiNT or the AES comes up.

There is no one algorithm for Daylight Savings: every country handles it differently. I had to deal with this problem in my own program, WorldClock :-) (Available from www.pair.com/gribnif/)

Not really, if all you are doing is stdio. It's only when you start to use Pexec() or any part of the AES that you might be hitting problems. Perhaps if you posted a skelton of your program, someone could help.

That's right, always use the a7 test. It works under Geneva, MTOS, MagiC
and, of course, old-TOS.

Someone else will be able to explain this part more accurately, but I
believe that most shells which run under MagiC launch new DA's (not at
startup) by treating them as programs. IIRC, there may not even be any way
to truly launch a desk accessory AS a desk accessory from MagiC after
startup. But I haven't seen later versions of MagiC so I could be wrong
here.

On the other hand, both Geneva and MTOS use the GEMACC env var in GEM.CNF
to determine which extensions are treated as DA's. Anything matching the
extensions is launched as a true DA with the correct (zero) a7.

Hi!

Can anybody tell me what's wrong with the following code? (Running under MiNT 1.14/N.AES)

```
   if (appl_find("V-CONFIG") < 0)
      Pexec(100,"V-CONFIG.PRG","",NULL);
```

The program (V-Config) is started, the parent keeps on running in paralell and everything looks fine. But when V-Config exits, it leaves a "empty" process, i.e. a process with status EXIT and size 0. If I call/exit V-Config a number of times N.AES crashes.

If I use mode 0 everything works, except that the parent is blocked. This is totally unacceptable as these two programs are supposed to talk to each other.

The Atari Compendium says that mode 100 is identical to mode 0 with only two exceptions: The parent runs in paralell with the child, and pexec() returns the pid of the child instead of an exit-code.

Well, I think I'm a reasonable person, so if using a cookie would be reasonable, I don't see why you couldn't talk me into it... :)

Meanwhile, I don't understand exactly what you mean. I don't see any problem in using a cookie, but then some other program must establish the cookie, because what I'm concerned with is reading out certain information, like timezone information and the location of directories. Normally, this is not the sort of information one would store in cookies, is it?

>a "empty" process, i.e. a process with status EXIT and size 0.

What happens is that V-Config leaves a "zombie" process, which is just
a placeholder in MiNT's process table that saves things (like timing
statistics, and exit code) that the program which launched it may be
interested in. When the exit code is collected by the Pwait() system
call, the zombie is deleted from the process table.

Zombie processes should be harmless, and will be deleted automatically
when their parents exit. But if you want to avoid creating such processes
in the first place, have your program do a Psignal(SIGCHLD, SIG_IGN) before
the call to Pexec(100,...). This will tell MiNT that the caller isn't
interested in the child's exit status.

If you mean the old 8-bit stuff, check out http://www.emulators.com/ - home
of the guys who wrote PC XFormer, the 8-bit Atari emulator. As well as
selling XFormer cables to do the thing you want, they have plans available
to build your own cable.

ATB, Frank.

have anyone seen the C code for the old atari game trucker?

if so, could you please email it to me..

From: gmiller@inca.co.nz (Gaven Miller)
Subject: Toolbox API (was: DLLs for Atari)
Date: 1997/03/18
Message-ID: <3137cd$11416.1a8@HERMES>
X-Deja-AN: 226427789
Newsgroups: comp.sys.atari.programmer

As you may be aware, I have been working on a TSR that gives DLL-like capabilities to the TOS platform.

I would like to make this a reasonably "open" standard for the Atari, so this is the beginning of a series of articles describing the Toolbox interface as seen by extensions/plug-ins/libraries (I have yet to settle on what the correct nomenclature will be), and by apps that use them.

The Toolbox originated as a resident library of code that I found I was using in all my apps.

Over time, it gained the ability to load extensions at boot time that could be called by the foreground app to do some specialised processing.

Now, before I release the Toolbox for general use (it has previously been used exclusively alongside custom apps I have developed), I'll begin by discussing the Toolbox/extension interface.

The Toolbox was designed around the TOS filesystem, and to load before MiNT.

After the Toolbox has loaded at boot time (from within the AUTO folder) and then finished initialising itself, it then switches to the path "\TLBX". Within this folder, it looks for "Toolbox Extensions" (with a filename extension of ".TE").

It then examines them, and if they conform to a small set of rules, the extension is loaded, and given time to initialise itself.

The extension receives info about the Toolbox it is plugging into, and a bit about the computer. It can then examine this info, and initialise itself. Once this is done, it must call a "callback" function, and then returning a magic "Yes/No" value, and a pointer to it's info block to the Toolbox.

Unfortunately, this is more an assembler-level interface. Higher level languages will need to have changes made to their startup stubs.

And then the Toolbox carries on searching for more extensions. When all have been loaded, a final clean up is done, and then the Toolbox goes TSR.

Later on, the foreground apps can load a specialised extension using a LibLoad() Toolbox API call.

However, only one copy of any extension (based upon a unique "cookie" identifier within the extension info block) can be loaded at one time.

At present, there can be only 16 extensions loaded at at any one time.
This value will be raised later on.

Following is the source code to a sample extension, complete with a couple of nonsence API calls. (It was written in 68k assembly language using Devpac 3.1).

It is known as a "dynamic" extension, as the ID number is generated when the extension is loaded. _NO_ extension my have a static ID number (other than those I have written aeons ago).

Please feel free to comment on it (in this newsgroup). I would like to make the Toolbox/Extension APIs an "open" Atari standard, and discussion involving other programmers will lead to a better standard.

Why can't I get vqt_name() to work? I think that's the right function :-)

I'm (trying) to use it like this:

```
     font_index=vqt_name(vhandle,number,font_name);
```

That compiles fine, but crashes while running!

I guess as I want to get font_name I should really use:

```
     font_index=vqt_name(vhandle,number,&font_name);      ????
```

But this won't compile!!!!

If anyone can supply me with a short little demo for changing/using fonts,
I'd be grateful. PS. I'm using NVDI 4.11 ----- Yes, those fonts!!

This is the kind of information that doesn't change a whole lot so
could be stored in a file (*.inf) which I suspect is available even
to auto folder programs (how would some of the editors etc work
otherwise.)

This should get you started ...

```
/*
 * Example of rudimentary VDI text output. It's in a window but only so it
 * doesn't mess up the desktop. Lot's more work would be needed to do anything
 * useful window-wise.
 *
 * This code goes through the available bitmapped and vector fonts displaying
 * the name of each font using the font being described.
 *
 * One of the biggest problems with VDI work is getting something happening.
 * After that, you get to know where the problems can crop up and debugging
 * is easier - the last thing you need is to spend all night tearing out your
 * hair only to find your code has been working but drawing in the background
 * colour!
*/

/*
 * Replace the followinf headers with suitable ones for your system. You may
 * need to declare some arrays for the VDI - see your compiler docs.
 *
 * Most of the common (and less common) names such as WH_DESKTOP etc have
 * been replaced by explicit values so the code compiles easier. Names would
 * normally be used however.
*/
#define  DEF_VDI

Try defining font_name as

char font_name[33];

BTW, font_name[32] will contain a 1 on return when the font is
proportional.

The ST parallel port is nothing more than one of the parallel port

of the Yamaha sound chip.

Register 7 in the Yamaha allows you to change from output to input
(for the data bus D7-D0).

I guess that the behaviour of Ack and/or Busy can also be changed, but
this time it is related to the MFP.

Please let me know if you need more information (E-mail me) and I will
bring some documentation with me next time I come to my office.

Check the number variable. Perhaps you pass an invalid value. It
should not be greater than the value returned by vst_load_fonts().

Hi, I am doing a program, It's an ACC, it works fine so far except
that under MINT, it doesn't want to appear in the accessory menu.
With PS, I can see that my acc is loaded, but is in the sleep status
and not ready status, thu snot appearing in the menu.
If I SIGCONT my acc it will then appear in the menu.
So why my acc doesn't receive the correct signal when the machine
boots in mint?
BTW, this ACC works fine under TOS and Magic.
Any help would be appreciated.
NOTE:. I use GFA basic.
I use appl_init() and menu register
Thanks

The ST isn't 8 bit either. He was referring to the "old" Atari 800
(XE/XM/whatever) series of 8 bit computers.
But you are right, the ST isn't old. 12 years is nothing compared to the
time UNIX (not actually a system but an OS) has been around. And what to
think about PC's... They've been around for 17 years.

Hi,

I'm not sure if this is a GFA basic problem, but I've done it successfully in C. You might be able to convert it to GFA basic.
This is a piece of code from my GEM interface for mp2 player. This works for me on both TOS and MiNT, haven't tried MagiC myself, but others tell me it works there too. The _app variable is a PureC variable to tell if the program is run as .PRG or .ACC, if the program is always .ACC then this wouldn't be neccessary.

```
        if ((app_id = appl_init()) >= 0)
        {
                if(!_app)
                        acc_id = menu_register(app_id, "  MPEG2 Audio ");

         /* program follows */
     }
```

Hope it helps!

Tomas

Gaven Miller (gmiller@inca.co.nz) wrote:
: The Toolbox was designed around the TOS filesystem, and to load before MiNT.

: Unfortunately, this is more an assembler-level interface. Higher level
: languages will need to have changes made to their startup stubs.

I have had a look at the sample code in your original post -- keeping that architecture is going to make it very difficult to write TE's in anything other than assembly. My component system doesn't perform any checks to see if you're loading a valid component -- I have authorised and unauthorised components wherreby the system admin (my system is MiNT only) sets up the authorised stuff, and users set up their own unauthorised components. If a user tries to load some program as a component, then they will only crash their own component server, not the entire system.

When a component is loaded, the component server responsible for it simply JSR's to the first instruction in the text section (if you know anything about writing .XDD's or .XFS's in C, then the method for writing the startup stub is identical). This function is expected to return some information about the component and is given a few bits and pieces as parameters on the stack.

I also note that your system is a TSR:

: Later on, the foreground apps can load a specialised extension using a
: LibLoad() Toolbox API call.

this will cause problems under a multitasking environment (which is really the only place where components/TE's/modules/shared libraries/what ever are needed). If we're in SingleTOS with no MiNT, then we have the same problems that desk acessories have with allocating memory: the running application loads a module, and that module's memory is owned by that application. Some other application that is running could theoretically use the module as well (the whole point about creating modules is to share code) but when the host application quits, the module's memory is freed up and the other clients using the module crash.

You could argue that modules can be used in a simgle task environment to facilitate plug-ins to programs (file filters to load different formats of pictures/sounds/text/etc) but a TSR system would miss out on the whole code

sharing idea.

The trick is to make the program that governs your modules (Toolbox manager/component manager) a process that is always available. My component manager, once loaded, just sits there and waits of a message to be sent to it telling it to do something. Basically, it would be used for two things: loading a component (so that component's memory space belongs to the component manager); and removing a component from memory.

Once a component has been registered with the component manager, it would normally be unloaded from memory, and only loaded back into memory when some process wishes to use that component. Once all the processes utilising some component have finished with it, the component is removed from memory again. An application sends a message to the component manager to ensure that the component it wishes to use is made ready. The result from this operation is the pointer to that components info block. When an application is done with the component, it just sends such a message to the component manager again.

: At present, there can be only 16 extensions loaded at at any one time.
: This value will be raised later on.

I can have as many as memory will permit -- I have written a defragmentable memory allocator to help out with this :).

: Please feel free to comment on it (in this newsgroup). I would like to
: make the Toolbox/Extension APIs an "open" Atari standard, and discussion
: involving other programmers will lead to a better standard.

I will post my standard for component managers/servers in the next few days for a comparison. However, one thing you must understand is that my code is far from completed. The first version will most definitely not have unauthorised components (a security feature, but then most people won't need to worry about this anyway!).

Cheers,

James Cox

Hi thanks for the help, but here is what I use exactly. It looks like
what you wrote down there.

```
' IS it really an .ACC
ap_id&=APPL_INIT()
'
IF ap_id&<>0 ! not interpreted
  ' insert .ACC into menu bar
  me_id&=MENU_REGISTER(ap_id&,"  myprogram")
  DO
    ' detect .ACC selected
    ~EVNT_MESAG(0)
    ' ? is it our .ACC?
    ' note check both for an acc, and it is our acc
    IF MENU(5)=me_id& AND MENU(1)=40
      deal_with_acc ! if so deal with it
      ' and return back to here
    ENDIF
  LOOP ! .ACC's are endless loops
ENDIF
```

Any idea?
thanks. :)

Cookies created by TSRs often contain structure pointers, which
means they can provide all sorts of information.

But if all you want is to read some previously established data by
one program, then a *.inf file is the way to go. I thought you were
trying to create an environment variable to be used by other
programs.

Re. environment variables: it's bad enought that we have to support
bad (UNIX) programming practices. The least we can do is not
propagate them.

Does it exist a COBOL compiler for the ST (well, I have a Falcon) ?

There is a lot to be said about the MFP and the timers.
I really think you should try to get hold of an Atari reference manual,
like "Atari ST Internals" or the "Atari Compendium".

Yup I know. I missed that one. I thought everyone used evnt_multi in the
main loop. ;-)

So what about writing one for PNG insteed? Sounds like a much better idea.
As PNG support isn't as well spread yet it would be a good thing and
people wouldn't need to make their own, they just use the PNGDSP.PRG

placed in their autofolder. :-)))

How to Copy protect a disk

My idea is to damage a sector/track of the disk, 78 79 something late and not used,

Then my program at boot up reads in the tracks, this is sooo quick:) if there is an error then ok, if no error then not the same disk, a simple error that fcopy and any other decent copier would fix automatically,

First..I dont know how to damage the disk ?

Second..Anyone else any ideas for copy protecting a disk ?

Cheers...!ynoT

its beta phase now.
     I got the original sources from J. Baumgardner, for his
Telnet 1.00, or something before the final versiion.
I have extensively reworked and rewritten most of the code, except for the
STiKstuff and thw windows structure. To work out the new Esc code
sequence logic, I adapted t100, a plain vanilla source from umich,
which uses aline coding, and souped up vt52 commands to LOOK like a VT102.
That works fine as a dumb terminal thru a direct dial-in to my VAX at
the lab, which uses VT100 codes extensively.
     The command codes and they keypad instructions now work (mostly)
properly in both the t100, and the new TELVT102, which goes thru STiK, to
a slip acct., then telnetted to the same VAX. The slip line is running 115200,
thru a 28.8 modem. The T100 goes thru a different direct line at 19.2 with
14.4.
     NOW, the important part of the problem. I ran a few timing tests.
With TELVT102, I typed out a 70k file to the screen, using vro_cpyfm
to do the scrolling, at the end of each line received. It took about
4 min, or a transmission rate of about 300 cps. I removed the scrolling
at the <CR>'s scrolling only at the end of each packet, and the speed went
up to about 450 cps, taking about 2.6 min.
     THEN I connected with my T100, which uses aline and emulartes
the vt100 commands with vt52 codes thru aline, and scrolling at the
end of each line, it only took 1:05 , or abou 1k cps.
     Using the same line,I used Connect, which uses GEM-type windows

but MAY be written in machine code, at least parts an it took 35 secs
or about 2k cps.
    I even use NVDI, which is supposed to speed up GEM,no?
Any ideas why vro_cpyfm is so d--n slow?? Is there somewhere I can
find some source to adapt that uses VDI more efficiently?
    If you reply, remember I am a novice 'C' programmer, who
has almost no references other than the C manuals, and the K & R book.

1 Clear the disk with a magnet.
2 format the disk double sided, 9 sectors per track, 78 tracks
using fcopy or another formatter
3 change the number of sectors to 1440 in the bootsector (offset $13) and set
the Media descriptor to $f9 (offset $15) (that one might be
already set to $f9 by the fromatter)

> Second..Anyone else any ideas for copy protecting a disk ?

Learn assembly, read all about the FDC and the DMA unit and obfuscate a track.

Bye, Hans

Hi,

I have heard and read different stories about MagiC and its
so called memory protection.

How is the true story? I have heard several people saying
that MagiC doesn't have any memory protection at all (which
looks to be the truth as it's easy to get "memory block
destroyed" and a reboot as only solution, while MiNT handles
this just fine) but they claim in the docs that they have.

So how is the story? Will MagiC ever get proper memory
protection, or does it already have it, but it just doesn't
work very well or not as it's supposed to?

Anyone?

As far as I can tell, MagiC does not have proper memory protection. It's supposed to be improved in v5.04 but is certainly pretty bad in v5.03 (which I have). Proper memory protection can only be implemented on processors 68030 and above or 68020 with a co-processor. Since MagiC also runs on STs with 68000 CPUs, the only way to implement it properly is use the MinT method of having two versions of the executable, one that uses memory protection and one that doesn't. Currently, it doesn't do this, though there is no reason why it shouldn't be implemented in the future. One of the Black Scorpian programmers recently wrote a small program to test MagiC's memory protection. All it did was write to memory that didn't belong to it. Magic crashed.

Regards
Martyn

Write a fake sector checksum.
Problem is that a good copy program will copy the sector and
ignore the faulty checksum. So you will end up with a perfect
copy including the error. But you will at least fool the desktop
and a few "not-so-good" copy programs...

> Second..Anyone else any ideas for copy protecting a disk ?

I think that writing info between the sectors is the way to go.

Hello Tony,

Have you seen CD-Secure 2 by C-Dilla Ltd? Our software prevents any copying of the disc by taking a random record of the machine's environment like a fingerprint and binding the discs to that individual machine. Any copies taken will only work on one machine unless they ring you and ask permission and you exchange codes...and possibly money too.

> operations, it has a sine/cosine table already in ROM.

True in general, but the JPEGD.PRG particularly does *not* use
builtin sine/cosine table. The reason is that the IDCT (Inverse
Discrete Cosine Transform) does only need the cosine values at
a few discrete points, which can be precalculated and used as
inline constants or constant tables in practice. In fact, all
practical IDCT implementations take this approach.

You are right that the DSP's superior performance in this regard
is mainly due to its efficient (and accurate!) multiply-and-add
type operations (MAC and MACR instructions).
BTW, the DSP is still superior in architecture compared to the
recent "MMX technology" from Intel.
See for example Intel's sample IDCT implementation for MMX under

  http://developer.intel.com/drg/mmx/appnotes/ap528.htm

They use the 'quick-and-dirty' (fast but less accurate) AAN
(Arai, Agui & Nakajima) integer IDCT method, because the more
accurate (but still fast IMHO) LLM (Loeffler, Ligtenberg &
Moschytz) algorithm didn't provide sufficient speedup on
the MMX.
The DSP, however, can perform accurate IDCT methods *without*
losing performance!

BTW, the current JPEG library from the IJG (Independent JPEG
Group) provides both (AAN & LLM) IDCT algorithms (see files
'jidctfst.c' and 'jidctint.c' respectively).
1stGuide, for instance, uses an 68000-assembly optimized
version of the more accurate LLM method internally for
maximum output quality :-).

Regards,
Guido

Summary: MIDI file format request
Organization: University of Sussex
Keywords: MIDI
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.programmer

I am looking for the MIDI file format -- a friend of mine is writing a program
for his 3rd year project at Uni that composes music, and he wants to be able
to listen to it. So we're looking for the MIDI file format so we can get it
onto my Atari.

There's probably a better place to post a request for this, but I thought I'd
try here first.

Cheers,

James Cox

PS: There is an IEEE (Institute of Electrical and Electronics
Engineers) standard (No. 1180-1990) for required accuracy
of IDCT implementations, to which the JPEG and MPEG standards
refer.
Recently there was rumor in Usenet that IEEE has withdrawn
this standard just because Intel's proposed MMX AAN IDCT
implementation failed the conformance tests :-/.
The LLM method (with appropriate implementation), however,
does conform to the accuracy requirements of that standard.

Hello.

FIGlet is a freeware program that

```
                _                    _   _     _
             __| | ___   ___  ___  | |_| |__ (_)_ __   __ _ ___
            / _` |/ _ \ / _ \/ __| | __| '_ \| | '_ \ / _` / __|
           | (_| | (_) |  __/\__ \ | |_| | | | | | | | (_| \__ \
            \__,_|\___/ \___||___/  \__|_| |_|_|_| |_|\__, |___/
                                                        |___/
                    _      _              _
                   | | o  | |            | |    o
                   | |    | |   _    _|_ | |        ,
```

```
|/  |  |/_) |/     |  |/ \   |  / \_
|__/|_/| \_/|__/   |_/|   |_/|_/ \/
```

Someone did a port for the Atari for an older version, but I lost contact with them. If any of you is interested to do this port, feel free to grab the source code from the unix distribution from either the ftp site ftp.nicoh.com in the pub/figlet/program/unix directory, or from the web site http://st-www.cs.uiuc.edu/users/chai/figlet.html#who

When you're done, upload it to the pub/figlet/incoming directory and email me and I'll put it in the proper place, and announce it to FIGLET-L.

READ THIS!!!!

NEW VERSION ! 1997 (Legal Questions Addressed!)

(Excerpt From Bob Novak Who Started This New Version)

In late October of 1996, I saw an article in an internet newsgroup telling me that I could make $50,000 within a month for an investment of only $5. I thought, "OH YAH!! I'VE GOT A BRIDGE I'LL SELL YOU TOO!!" It sounded like all the rest of the "get rich quick" schemes and scams I've seen over the past 40 years or so.

I spoke to my attorney, a few friends, and family about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. After rejecting the idea at first, it kind of played on my mind and I thought, "what if it really worked?" I realized all I had to lose was $5.00, I usually blow that much on the lottery every week anyway, so I figured what the heck, and decided to give it a shot.

Within two weeks I began receiving money in the mail! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $46,812.00! It came from everywhere in the world." Lately, I've doubled my efforts and the money is rolling in even faster. I would tell you how much but then the IRS would know also, let's just say it's a VERY comfortable living. Now, I am really going to work! If I can make as much as I have, and still am, on a lousy $5.00 investment, why not double it and make the "Big Bucks" twice as fast? Anybody can afford to gamble $10.00 on a chance to make $100,000.00 or more in a month, especially when the business has already proven itself.

If you follow the three steps below, there is no reason why the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $10, and you receive a return on your investment. So does the next investor. THIS IS NOT ILLEGAL, THIS IS NOT A CHAIN LETTER, THIS IS PERFECTLY LEGITIMATE. (See additional legal details below.)

THE PROCEEDURE IS SIMPLE:

1) Invest your $10 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending two dollars to someone; you're paying for a legitimate service.) Fold two $1 U.S. Treasury bills, money order, or bank note inside each piece of paper, and mail them by standard U. S. Mail to the following five addresses:

1. David Wiseman
   P. O. Box 1648
   Clarenville, NF A0E 1J0
   Canada

2. Sean Bennett
#605 - 9825 103 St
Edmonton, AB T5K 2M3
Canada

3. Gregory Pang
Box 60367
U of A postal outlet
Edmonton, AB T6G 2S6
Canada

4. Pawel Koper
#4-7120 Pandora St.
Burnaby, BC
V5A 1B7
Canada

5. Thomas Walter
Parsbergstr. 14
82110 Germering
Germany

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. You can do this by simply retyping the article or reposting it to other newsgroups with the edited addresses.

3) Post the article to at least 200 newsgroups. There are 22,000, so it shouldn't be hard to find that many. Remember, there are no "Free Lunches" in this world so the harder you work the more money you will make.

You are now in the mail order investment business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return will be. If you wish to remain anonymous, you may use a pseudonym, but make sure your address is correct.

LEGAL ? ? ?

People have asked me if this is really legal. It is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online businesses and methods of generating income at home. Remember - people send you a small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to you.

NOW HERE IS WHY THE SYSTEM WORKS:

The internet is growing at a tremendous rate - it doubles in size every 4 months. Think about it. You see those "Make Money Fast" posts more and more. All that growth means profits for everyone who participates. There are no losers.

Of every 200 posts I made, I received 5 responses. That probably doesn't seem like much. You make $10 for every 200 posts with your name at #5.

Each person who sent you $2 now also makes 200 additional postings with your name at #4. i.e.. 1000 postings. On average therefore, 50 people will send you $2 with your name at #4. $100.00.

Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people=$1,000.00. They make 200 postings each with your name at #2=100,000 postings=5000 return at $2 each=$10,000.

Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $100,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES ONLY 200 POSTINGS! Total income in one cycle = $100,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $10, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. The more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $10, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $10 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money?" Big Deal, so you lose $10.00 but what are the chances of that happening? SINCE THIS IS A BRAND NEW PROGRAM AS OF JANUARY 1, 1997, YOU'RE IN ON THE GROUND FLOOR!

There are millions of internet users, and millions of new net surfers every month.

Remember- read the instructions carefully, and play fairly. THAT'S the only way this will work. Get a printout so you can refer back to this article easily.

Keep a list of everyone that sends you money, keep good books, pay your taxes, and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER-HONESTY IS THE BEST POLICY. WHAT ARE 10 DOLLARS TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! (We will monitor the program and if we find you have cheated by not sending your money to your five recipients, we will just dump you out of the system). This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50? or $5,000? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY!!!

Extra section:
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

The Fastest Way To Post To a Newsletter:

Simply highlight and COPY (Ctrl-C for copy) the text this e-mail message and PASTE it into a text editor such as Notepad and SAVE it (as a .txt file).

After you have made the necessary changes that are outlined above, Simply COPY and PASTE the text into the message section of the message composition window and to be posted to the Newsgroup and post it!

If you have Netscape 3.0 do EXACTLY the following:

1) Click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once)
THIS whole article WORD FOR WORD, except insert your name at #5, and remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE

in THIS BOX, RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX.

Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.

NOTE: If you don't want to type in the whole article by hand, AND you know how to use a plain text editor (like Notepad), you can edit the file ahead of time, then attach it as shown in step 6.

5) If you still have all of your text, send or post to this newsgroup now by just clicking send, which is right below FILE, and right above Cc:.

6) Here's where you're going to post all 200. OK, click on any news group then click on 'TO NEWS', again in the top left corner. Leave the NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT BOX, hit TAB once you're in the body of the message. Click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click on the file, and then click 'OPEN' now click on OK; if you did this right, you should see your file name in the attachments box, and it will be shaded green.

Note: If you don't want to type in the whole article and you know how to use a plain text editor (Notepad), you can edit the file ahead of time, then attach it.

QUICK TIP!

You can post this message to many newsgroups at a time by simply selecting a newsgroup near the top of the screen, hold down the SHIFT key, and then select a newsgroup near the botton of the screen. All of the newsgroup in-between will also be selected.

IF YOU USE IE EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT MOUSE BUTTON, highlight this article. then press the "crtl" key and the "c" key at the same time to copy this article. then print this article for your records, to have the names of those you will be sending $1 bills to.

2) Go to the news groups and press "post an article". A window will open. Type in your headline in the subject area and then click in the large window below. Press "crtl" and then "v" and the article will be placed in the window.

If you want to edit the article, do so and then highlight and copy it again. Now every time you post the article in a

new newsgroup all you have to repeat is "ctrl" and "v" and
press post.

3) That's it. Each time you do this, all you have to do is
type in a different newsgroup, so that way, it posts to 200
DIFFERENT newsgroups, or more.

You see? Now you just have 199 to go!! (Don't worry, each
one takes about 30 seconds, once you get used to it.)

REMEMBER 200 IS THE MINIMUM. The more you post the more
money you will receive. AND THAT'S ALL THERE IS TO IT!!!

DON'T LET THIS ONCE IN A LIFETIME OPPORTUNITY PASS YOU BY!

The 200Hz clock is driven by Timer C, so using Timer C directly is
no more accurate than using the long counter at $4BC. As for
overflow, subtracting the start time should always give you the
correct elapsed time (unless you were planning to let it run for
several days).

Only Timer A is not used by the OS, unless you have DMA sound (which
uses Timer A for the frame counter). If you have a TT or Falcon,
you have a second MFP with another set of timers, of which only
Timer D is used (Serial 1 Baud Rate, TT only).

     Right then!

          The ST timers are created by theMFP68901 chip.
     There are 4 timers, timers A,B,C, and D.

          Each timer has a control register, and a data register.

          The main MFP clock is 2,457,600 Hz (This is entirely from

memory! Impressive huh?)

The timer control registers allow the main clock to be divided down, e.g. /4, /10, /16, /100, /100.

The timer data regs tell the MFP how many clock pulses to count before setting an interrupt.

E.G. 2,457,600 / 200 = 12.288 KHz

Data register = 61
hence timer frequency = 12.288 KHz /61
= 201.4Hz

In general it is better to use timer A, as it is not used by the system! (Avoids crashes!)

Hope this helps!

brian.

Hi!

I wondered if MiNT-threads can use GEM? I.e. can a thread run in a evnt_multi()-loop while the parent does the same?

: Since the programming docs are good, maybe it's posssible.

Yeah, someone should write a MiNT device interface for the thing...

: What is this 'evnx_multi()'?

It's an implementation of evnt_multi() that uses a structure instead of
the normal huge pile of parameters. Is faster and easier to use.
The call as implemented in the Sozobon C XGemFast libs is called evnx_multi()
but other compilers or programmers who implement it themselves usually use
some other name...

Actually, there is atleast one! In the GEMAR-distribution there is a
tape-XFS. With a small program (tape*) you can "mount" the tape and use
something like...

```
   tar cvf * /dev/mt
```

Haven't tried it yet, I broke my (Very expencive...) SCSI2-cable when I recased my Falcon :-(

> use 64 bit ints!

It has probably been said already, but I always try to follow the golden rule for portable code: "Never assume the sizes of data types"

And as to whether an integer should be a particular size, I fall back on what Kernighan (sp?) and Ritchie said in "The C Programming Language (Second Edition)" : An integer should fit the natural word size of the machine. (I've lost my copy of the book, so this quote may be a little fuzzy).

To me, "natural word size" refers to the ALU (Arithmetic & Logical Unit) width of the target processor, so an int would be 16-bits on a 16-bit CPU like the 68k, but 32-bits on a 32-bit CPU like the 020+ CPUs. DEC Alpha systems would use 64-bits as the "int" size, as that is the size of the Alpha ALU (and the Alpha can only deal with 64-bit integers - smaller data has to be loaded, masked, and optionally bit-shifted into the correct form that the ALU can deal with natively)

(CPU's work fastest when using ALU-width data. Smaller or larger data is
slower to deal with, and more likely to generate errors)

For a 68000 or pre-386 CPU this would mean 16-bit.

For a 68020 or 386+ processor, this would be 32-bit.

But the compiler writer is free to ignore this.

No, I tried to do this but it won't work. The problem might be in
the C's AES library (not re-entrant), but I don't know.

It really pissed me.. you can't fully use that wonderful multitasking
in programs because of that.

Normal AES libaries aren't re-entrant but there's mt_aes library which
claims to be re-entrant. Haven't tried it but if I remember right it is
designed for MagiC's threads. Probably works with MiNT threads also.
Can be found e.g. from ftp.cs.tu-berlin.de.

I have a Hades 060 clone and have tried to run GFA Basic version 3.6. It runs just fine, but the menu's are all garbled and cannot be read. I have to run the program in only two colors (mono) to get it to run properly. How is everyone running this program on a Falcon? Are you using a 2,4 or 16 color mode or are you using a 256 color mode?

Yes, I agree.

Ahem...
The ALU in the M68000 is 32 bit. Sorry, couldnt resist that!
My point is that it is up to the guy who writes the compiler to decide what
the "natural word size" is. Sometimes its obvious, sometimes it isnt.

No, the Alpha can deal with 32 bit integers in the
ALU *and* the memory. On top of that the latest
generation (EV5) can also load/store bytes.

GFA Basic is pretty hardcoded when it comes to draw it's menus and other
things. I only works in ST modes.
There was a preview of GFA Basic 4.0 with a GEM shell, but apparently, the
company that was in charge of its development never released it.

Unless you want to run in ST compat. modes, the only way to run it is
with the use of a good shell program or to write a little program
that changes your screen mode to an ST compat. mode before
automatically launching GFA.

I use G-Shell for GFA Basic. I believe it has been released as shareware
or perhaps freeware by now.

My patched GFA Basic runs in 640x400x2, 640x200x4, 640x480x2, 640x480x16,
320x200x16...
Don't know if it's the patch that does it, but try ftp'ing it somewhere
and see what happens...

I have an ST-Guide hypertext of the midifile format that I used to add
midifile support to Dump-It!
Email me for it, or if you prefer I can send the raw text to you - it's
also available around the net.

> The ALU in the M68000 is 32 bit. Sorry, couldnt resist that!

You must have a mutant 68k.

Can I buy it - it'll be worth something someday... {[:-)]

But seriously, the ALU in the 68000 is 16 bit - it can only work with 16
bit data in one pass. The 68000 (and its 16-bit friends [68010, 68331])
is, however, intelligent enough to make two (or more) passes at the data
when 32 bit data is manipulated. An "ADD.L d0,d1" instruction takes two
or more passes through the ALU before completion.

The first 32-bit ALU for the 68k appeared in the 68020.

(I believe this is covered in the comp.sys.m68k FAQ)

Hi,

I'm trying to get GCC 2.7.2 up and running to use C++.
But the problem is, all I can find is versions of
libraries for it that require 68030 and CoProcessor.
Unfortunately I don't have coprocessor, and anyway I'd
like to do software that works with every Atari.

Anyone know where to find libraries that work with
every Atari?

Thanks,
Arto Jalkanen

Sory, can't resist too.
The ALU of a plain 68k is 16 bit. All ALU operations on longs take 2 clock cycles more then the same on a word. If the 68k had a 32bit ALU there would be no difference.

Bye, Hans

I had to change the menu heights through code to make my programs work
in other resolutions. If you need to see some sample code I can e-mail
some to you.

Also, if you want to use the GET/PUT graphics commands, you will have to
make your own for the higher resolutions. I also have code to do this.

Thanks,

Jim Fouch

That depends on your definition of `32 bit processor`, but normally the
68000 is indeed considered a 16 bit processor (even though the 68k
architecture is definitely 32 bit). In the 68000, only the registers are 32
bit long, the internal data paths are not.
(In the same way, many 8 bit processors have 16 bit wide registers.)

>a 24-bit address bus? In a similar manner to this 386SuX/16 that is=20
>currently blasting some MODs at me?

The 386SX is very similar to the 68030 as used in the Falcon.
Both are fully 32 bit internally, but have a 16 bit data bus to the outside
world.
While the 68030 _can_ use a 32 bit bus, it's locked to a 16 bit one in
the Falcon.

This is almost certainly the case, since virtually all GEM libraries
used by compilers use global arrays for the AES contrl[], intin[],
intout[], addrin[], addrout[] and global[] arrays.

The only way to fix it is to either protect AES calls with an
interlock mechanism (i.e. a semaphore), or to fix them so that
they use local arrays.

Actually, I use the evnx_multi() call provided by Sozobon's XGemFast lib.
It uses a structure called XMULTI which includes GRECT structures for
rectangles, which is more or less what you described in your example.
I just didn't use evnx_multi() in my posting, because I gather that not
everyone is familiar with Sozobon C :-)

Yeah, I just recently saw the docs on the VFAT fs in some Linux Howto
file... Tjeez! It's a classic Crap Microsoft Backward-compatibility Patch!
It uses additional entries in the dir table which are sort of masked of from
the normal DOS fs to store additonal characters for the file name. That's
why W95 locks it's filesystems: to prevent properly written programs like
Disk Doctor from messing up (ie. fixing) the "crap" extra dir entries...
Unbelievable...

[code snipped]

Your program is (correctly) waiting for a message, use the evnt_multi
function with timer values set to 1 second.

Yeah. Use evnt_multi(...); specify several event types, including
WM_MOVED, WN_CLOSED and the one for a time delay. Use a time delay of
0. Remember that the event dispatcher will coalesce events if it can;
msg_buf[0] may contain several events |'red together.
When your code is called, if no other event occurs, you'll still get
your timer event immediately.

According to my Compendium, AES >= 3.40 have appl_getinfo(); it's just
that
AES < 3.99 don't support modes above 4. But since you can inquire the
maximum
mode number that's supported, this isn't a problem. You should really
check
for AES >= 3.40, then ask which functions are supported. If the
functions

to test for iconification aren't supported, you don't have
iconification.
Otherwise you do. No messing around with checking for version 4.0 and
MagiC
separately.

MagiC supports iconification as of version 3, I think. The AES version
reported is always 3.99 for MagiC (or has been up to now, as far as I'm
aware).

> out.

Sadly, Windows uses absolute addressing; it relocates the addresses
when the program is loaded, based upon the current positions of the
various system DLL's in Windows' memory map.

Some Windows programs "dynamically" load the DLL's, and use pointers
to functions (obtained with GetProcAddress(), I think - but I'm not
sure; I don't program Windows much at the moment) to call the
functions within.

DOS and the BIOS do indeed use "INT" instructions.

The disadvantage of "INT"/"TRAP" instructions is that they generally
take longer to execute (e.g. on the 68000, "TRAP" takes ~40 cycles!).
Absolute jumps take relatively little time by comparison, and,
on the 68000 and on older Intel chips, don't switch into any
protected mode. On the newer Intel chips, it appears you can mess
around with the memory mapping so that the chip switches into
a higher protection mode when it calls a particular routine. This,
I presume, is how Windows protects itself.

Hi!

In article <5dqleq$vjn@irk.zetnet.co.uk>,
    afoster@zetnet.co.uk (Adam Foster) writes:
> Is there a way of checking for events without making the whole program
> come to a halt? I have put the offending piece of code below.
Use evnt_multi() and wait for message- and timer-events (i.e. MU_MESAG |
MU_TIMER). Use a reasonable short amount for the delay between two timer
events. But don't forget that this period is the _minimum_ delay, so it
might easily happen that the next timer event occurs much later, e.g. if
some other application has locked the system for some time in a cooperative
multitasking environment. Also note that if a message event occurs, the
next call to evnt_multi() will again wait for the full timer delay and
forget about the time spent in the last call to evnt_multi().

Ciao

Thomas

Where does one get this VDI manual? All I have a re the 'C' manuals
for MWC and for Lattice 'C' 5.6. The fonts turn out to be standard GDOS
type fonts with ID 50, and 21 different sizes and faces, including Greek like
the DEC supplemental font and the special graphics fonts.
1. HOW does one compile a font into an application?

2. IF you load it at run time, where do you find these pointers, etc.?
Sorry to sound dense, but tho I have programmed for many years,

I am a novice at 'C', and "browsing" thru the manual to find the one needed command from a non-intuitive name list is a bear, to say the least.

```

You have to include MU_TIMER as well or it will just sit and wait, at the place you have marked, for the above events to come and no others.
Add MU_TIMER to your program and it should work just fine.

For ST-high you need XVGA or SVGA monitor and to know how to connect this monitor to ST. For ST-med and ST-low you need special multisync monitor.

Does anyone have any technical manuals or anything for the Atari400? I just bought one for five bucks, and I want to do some programming on it. I'd like to try it in assembler, but all of the books that I could find about that have been out of print for quite some time. I also need the specs for the hardware (power supply, i/o, etc.). Any help at all would be appreciated. Email SlothDelux@aol.com

Is the MiNT function Dpathconf() available on any other OS, such as MagiC, or is it MultiTOS only?

In other words, can you have a drive U:? I see from someone with MagiCPC that there is a U: drive but is it like MiNT's U:?
Does Pdomain(), Dopendir(), Dreaddir() mean anything under MagiC?

Thanks

As may people have said, use event_multi() with a timeout of 1 second...

Clipping is easy. 'Proffesional GEM' includes some clipping source I was=20
able to modify very easily into my program. My web page includes a simple=
=20
GEM program I wrote using only ProGEM... I'll have to add links to places=
=20
to get ProGEM. Maybe convert the 'proff' version of ProGEM to HTML...
(anyone know of a proff-to-HTML converter?)

I think it came with the infamous Developers Kit... I'm guessing this is th=
e=20
same thing as a standard GDOS bitmap font...

> 1. HOW does one compile a font into an application?

I'd like to know too... In C I think this involves converting a binary=20
file to hex codes which are placed into a static array...
 =20
> >Instead of doing the normal vst_load_fonts call, you will alter your=3D2=
0

I am also a beginning C programmer. I think it has something to do with=20
v_opnvwk(). In my program it looks like this:

```
void init()
{
=09WORD work_in[11]=3D{1,1,1,1,1,1,1,1,1,1,2},work_out[57];
[snip]
=09v_opnvwk(work_in,&vdihndl,work_out);
```

[snip]
}

I think work_in[] is what your looking for. ProGEM (the only tutorial=20
I've read...) doesn't explain v_opnvwk() at all, what exactly are=20
work_in[] and work_out[]??? As you can see they are just local variables=20
that are ignored and obliterated once the init() code is finished...

Why don't you print or save this info in case you need it in the future?

Hello Friends,

It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you

within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services

Refer to the Compendium (Appendix C) for the file format. The fonts will be stored as a raster image 1 character high and 256 characters wide, with a table of horizontal offsets to each character. You can copy them to the screen using vrt_cpyfm().

The reason the DSP is good at decoding JPEGs is that JPEGs use a
cosine transform. Not only is the DSP good at multiply-and-add type
operations, it has a sine/cosine table already in ROM.

... and when the user CTRL-clicks the name instead of the one above/below it?

This will kill the accessory under MTOS, and will leave any app with
callbacks pointing into the accessory in a state of readiness to crash.

In a moment of weakness (and curiosity) some years ago, I picked up a copy
of Petzold's book "Programming Windows 3,1". After reading it, I was
amazed at the level of complexity an app has to go through to do anything.

I am still going to therapy sessions twice weekly to "normalise" myself. {[:-)]

Or, when not unnecessarily base64'ed [why not tidy your sigblock?],
>Just wondering what happens if I call appl_init() and gl_apid comes
>back -1? Can this happen? What does it mean?

What is supposed to happen - with the C bindings anyway - is that you call appl_init(), and get a short int back, with -1 meaning failure. However: the bindings supplied with the original Atari developer's kit were supposedly defective; appl_init() returned garbage, but it did initialise a global short int gl_apid to the return value. [See the Tim Oren GEM tutorials.] If it happens, what it means is that the AES can't allocate itself some resources to run a GEM app. I've never seen this.

Well you must have a different edition of the AC. In the copy I have it says
appl_getinfo is present from AES 4.00 and modes above 4 are only supported
on AES >= 4.1 (which makes sense as AES 4.0 doesn't have iconify etc.).
This is also confirmed by my copy of Modern Atari System Software which
says that appl_getinfo is available from AES 4.0 (and doesn't mention AES
4.1 at all, and doesn't mention modes above 4)

I didn't get a chance to check my compendium CD, but I expect this gives the
same.

>But since you can inquire the maximum
>mode number that's supported, this isn't a problem. You should really check

How? I couldn't see any way of doing this?

>for AES >= 3.40, then ask which functions are supported. If the functions
>to test for iconification aren't supported, you don't have iconification.
>Otherwise you do. No messing around with checking for version 4.0 and
>MagiC separately.

Um, well as mentioned above you DONT have appl_getinfo (acording to Atari
Compendium and MASS) < 4.0 so you STILL cannot test without the dirty
hack (sorry, but it is...)

Anthony

> mode number that's supported, this isn't a problem. You should really
> check
> for AES >= 3.40, then ask which functions are supported.
The way I use to check for appl_getinfo() is the following:

```
if ((aes_version >= 0x340) || (appl_find("AGI?") >= 0))
{
    < use appl_getinfo() with any mode and respect the return value - 0
      means that the requested information is not available, 1 means OK >
}
```

Note that "AGI?" in the appl_find() is _not_ filled up to 8 characters, so
even if there was an application running with that name, it wouldn't be
found by that call. I don't know whether MagiC supports that "AGI?"-thing,
but at least WINX does, as it implements some appl_getinfo()-modes (but not
all, so it's _important_ to check for the return value of all calls to
appl_getinfo(), no matter what information was requested).

Ciao

Thomas

Hi!

In article <E5K1Cw.6vx@cix.compulink.co.uk>,
msbaines@cix.compulink.co.uk ("Mark Baines") writes:
> In other words, can you have a drive U:? I see from someone with MagiCPC that
> there is a U: drive but is it like MiNT's U:?
> Does Pdomain(), Dopendir(), Dreaddir() mean anything under MagiC?
It does. But why bother? Just use the calls and check the return value.
GEMDOS has the nice (and documented) feature to return -32L (EINVFN) for
calls which are not supported by the current version.

And btw: The presence of Dopendir() & Co. does not automatically mean that
there's a drive U (and vice versa). For example, there are some MetaDOS
ISO9960-drivers which support these calls, even though there's no drive U in
the system.

But you may rely on the fact that if there's a drive U in the system (use
Dsetdrv(Dgetdrv()) and check bit 20 of the result), it will act mostly
"MiNT-compatible", e.g. that there are subdirectories dev and proc.

Ciao

This means that the call has failed, e.g. because the system doesn't allow another GEM application or has memory shortage. Always check the return value of appl_init() and quit your app (_not_ using form_alert()) if it's less than zero.

Or did you mean appl_init() has returned a value >= 0, but the value of the app-ID in the global-field is -1? This would be a bug, either in the library you're using, or in the OS.

And please, next time use a newsreader which is able to post US-ASCII as US-ASCII, and not BASE64. I was lucky that my newsreader automatically decodes that, but that does not mean that it's an allowed form of posting text to the usenet ...

Ciao

The Atari Programmer's User Group

ICTARI 43 is now available from the usuall place:

http://www.elis.demon.co.uk/ictari/ictari.htm

This is the first issue since I took over from Peter Hibbs as editor. This is all rather new to me, so please bear with me. I'm getting dangerously low on articles for next month, and the readers who download ICTARI from the WEB site contribute far less than the readers who send disks. -I cannot produce the magazine without your input. Doom and gloom aside, I can see no reason why ICTARI shouldn't continue.

Have Fun,
"Augeas"

```

BTW, in order to "include MU_TIMER" you would have to change the evnt_mesag to evnt_multi.

Alternatively, split your program into two threads; one which handles events and one which does the ongoing processing.

This has the advantage of letting the kernal do the multitasking, which should make the multitasking smoother, and you don't have to bother with splitting the process up into slices yourself.

The disadvantage is that not all versions of TOS support multithreading, so if you want your program to be backwardly compatible you would have to implement both options.

Hi, the acc I just did can not be loaded correctly.
With all the aes it works fine, except the AES 4.1
The result is just blank. The acc is not in the menu bar, BUT! in the
processes it shows that it has been loaded, but just in state "STOP".
If I cont this process, then it will show up normally.
What do I need to implement in my program to load it up correctly with
mint/aes4.1?
this problem only appears with this aes version. Even with naes it
does the same, and I believe Naes is considered as 4.1 as well.
any help/tip would be appreciated.
Bye

>=09v_opnvwk(work_in,&vdihndl,work_out);
>[snip]
>}
>
>I think work_in[] is what your looking for. ProGEM (the only tutorial=20
>I've read...) doesn't explain v_opnvwk() at all, what exactly are=20
>work_in[] and work_out[]??? As you can see they are just local variables=20
>that are ignored and obliterated once the init() code is finished...
```

work_in[] is supposed to allow some defaults to be set up when you open the workstation simply to save you having to perform specific initialisation calls.

```
work_in[0]    Device Number
     1    Line Type
     2    Line Colour
     3    Marker Type
     4    Marker Colour
     5    Text Face
     6    Text Colour
     7    Fill Type
     8    Fill Style
     9    Fill Colour
     10   Co-ordinate System.
```

This mechanism is broken on early Gems thus you always pass the values you have listed above because at best other values are ignored and at worst it can crash the system. ie you are forced to use vdi calls to set up alternatives. Not a problem - just slightly annoying.

The work_out[] array is filled by v_opnvwk() with values which tell you about the virtual device you have opened. I'm not about to type in the info about all 57 of them - perhaps someone else already has it in

a file?

It does not matter that the arrays are local. Each successful v_opnvwk() [non zero return value iirc] allocates yet another internal virtual workstation structure. The work_in[] contents are copied into this and other settings are copied to work_out[] before it returns. You are perfectly at liberty to trash both arrays after the call. vq_extnd() can be used to obtain the same 57 words or the "extended" words (yet more info). Some of the information is very useful and some of it is useless - it depends on the task in hand.

Where can I locate compression source code? ie ZIP or LZH.

I want to create a plugin for my Toolbox TSR that can handle compression on a system-wide basis.

So, one would be able to place the following functions in your code, and have them resolve to appropriate code within the compression extension (Toolbox plug-in):

```
archandle = arcCreate( "foo.archive" );
arcAddFile( archandle, "bar.file" );
arcExtractFile( archandle, "blat.file" );
arcCompressBlock( srcptr, src_size, destptr, dest_size );
arcExpandBlock( srcptr, src_size, destptr, dest_size );
arcDeleteFile( archandle, "redundant.file" );
arcCloseFile( archandle );
```

... as well as any I may have forgotten.

(An immediate use for this code would be in my DESKFMT background disc formatter/copier for MultiTOS. One could compress disc images as written by it and stored on the hard drive)

X-Deja-AN: 218953014
Newsgroups: comp.sys.atari.programmer

As I have found out, some debuggers tend to pop up with an error message when one uses an illegal opcode, like TRAP #0 (which I use to call my Toolbox TSR or one of it's plug-in extensions)

MON, as supplied with Lattice C and Devpac 3.1 is a prime example.

Unless I write a daemon to set the trap vector to the right address, MON will pop up with "invalid Trap" every time I use it to debug an app which uses the Toolbox)

So, in the interests of making it more universal, I was thinking I'd patch into the XBIOS vector, and add a new XBIOS function which will resolve to the Toolbox code.

Is there any info as to what function numbers are available beyond those already defined? Or can I just simply add function numbers willy-nilly and include documentation to say "Function number XYXX is used to ..."

I am currently looking at function code 'tb' (0x7462, 29794) or 'TB' (0x5442, 21570) to call the Toolbox from the XBIOS vector.

Any ideas, guidelines, comments?

I am writing a MIDI sequencer and so would like to record incoming MIDI information to an accuracy of about 5ms.

I know that this could be done with the 200Hz clock at $4bc, but I'm not sure this would be accurate since there is the possibility of overflow occuring.

I have tried hooking into Timer C without much success, as my routine always crashes after it has run. Does anyone know about the functions of the timers, including information about the data registers? The Lattice C books don't go into enough detail.

TIA,

Mark

Has anyone has any experience of using the ST's timers to record
incoming MIDI data?

I have tried hooking into Timer C without success to time the data to
the nearest 5ms (which is what I would like to do).

Please could anyone shed some light on this confusing subject, as the
Lattice C manuals don't give enough information about timer registers
etc. for this sort of thing.

I have also tried reading the value of the 200Hz clock at $4bc but I
don't know how to cope with overflow situations!!!

TIA

Mark

As I see it, you should use the evnt_timer. With this event you will get an event at the specified time intervall. Each time you call you function that updates the display of the clock.

Good luck.

Yours sincerely

No, unfortunatly, you would have to 'roll your own' interface to it.

Since the programming docs are good, maybe it's posssible.

>According to my Compendium, AES >= 3.40 have appl_getinfo(); it's just
TAC is wrong here. appl_getinfo is only available from AES 4.00. The first 4
types are available only. Types 4-14 are only available from AES 4.10.
However, Magic has an AES of 3.99 and it is available there, so you do need
to check for the presence of MagiC apart from AES version.

TAC gets this wrong in many places. On the whole where it refers to 3.40
substitute 4.00.

I have a whole list of TAC errors collated from around the UK which runs to
29K long.

I'd like to get some samples of GFA Basic (Version 2.0 or 3.5) source code if anyone out there has some good examples. I'm trying to learn GFA Basic some and learn better by studying and changing items in others source code. If anyone out there has some they are willing to share, it would be greatly appreciated. Thanks Mike

j > And are there any free libraries for Pure C (I have 1.1) that
j > supports these?

Not free, but Geneva includes a NEW_GEM.LIB for Pure C.

j > Maybe my current libraries has 4.0/4.1 support, it supports
j > appl_search() although it's not mentioned in the helpfiles.

It is in the English version; at least, whatever is in AES.H is
documented in the help files. What's missing are mostly new window
features and object flags, which are only macros.

l > What is the best way to check if an AES supports iconification?

```
    appl_getinfo(AES_WINDOW, &wf, &unused, &gadgets, &unused);
    if(gadgets & 1) { /* iconify supported */
```

Of course, you might want to check if appl_getinfo() is supported
first.

g > However, if I was writing a multi-tasking OS...

Autorun programs on a version of TOS which doesn't support cookie jars do not multi-task. Geneva REQUIRES JARxxx.prg (I don't know what MagiC does for it's cookie jar).

The one I gave the source code for has only one good feature: it doesn't take up much RAM.

Er, what makes it worthless? I use it quite a bit, especially with
CAB. It's great to iconify CAB while it's downloading a slow web
page. It allows you to do other things....

Yeah, but my program needs to be able to iconify. And I want to be able to
check if the OS can do it, and if it can't, use the fuller button as an
iconify button (with some iconify routines, ofcourse).

What makes it worthless is that you can only iconify if the user
clicks the SMALLER. There is no way to actively iconify a window.
Also, many applications don't support iconify all, so if someone
control + clicks on the smaller a slot gets reserved, but no
icon appears. The slot will be empty until you reboot.

Truly one of the worst protocols I've ever seen.

reply-to: bdc2@po.CWRU.Edu (Boris D. Cahan)
newsgroups: comp.sys.atari.programmer

Can someone help me? I am trying to convert a program written for GCC to
Lattice C. I had it running before, with the help ofthe minltibs for
Lattice C from Hensa, but fouled up my disk directories, and lost the lib
changes I had made. The problem is rather trivial, I am afraid, but
beyond my C state at the moment. The program used __aline
 and __FONT, which are in the GCC and mint libs,but notin Lattice.
__aline is something like li_d0 and __FONT is now LA_FONT.
But I don't know enough yet about structures to get it towork.
If someone can help,who knows GCC and Lattice, I could send the one
short routine (about 100 lines with 2or 3 lines to fix) to show me how
to fix it.
    HELP?????

>What is the best way to check if an AES supports iconification?
You don't necessarily need to know, just program iconification into the
program (window parts list must include SMALLER and react to any WM_ICONIFY
messages in your evnt_multi.

>What is the best way to check if an AES supports iconification?

No need to bother. Just implement support for the messages. After all, you won't get them if they aren't supported.

There is an alternative iconification server which is more powerful and pretty easy to implement. It comes as an auto folder program and a cookie called 'ICFS' iirc and thus can work on any system. It is available for download somewhere but I've lost those details. Hopefully I've said enough for someone else to know what I'm on about and fill in the gaps. ;-)

Subject: Recovering from Bus errors
Date: 1997/01/25
Message-ID: <11a7cd$134c.28f@HERMES>
X-Deja-AN: 212118516
newsgroups: comp.sys.atari.programmer

As part of my Toolbox TSR, I'm trying to determine the exact amount of RAM
a machine has installed - so the tlbxMachine call I've implemented will
report the correct amounts of RAM installed.

The documented system variables _phystop (addr $42e) and _ramtop (addr
$5a4) are supposed to give the address of the first "unaccessible" byte
beyond the end of installed physical RAM.

However, as some software (for example Hisofts reset-proof Ramdisc) lowers

_phystop, I have been trying to write a piece of code which validates the values stored in those two system variables.

All goes well until the code hits the RTE at the end of my bus error handler, and then the whole machine hangs - no bombs, nothing. Only a press of the reset button (or keyboard reset) will cure it.

The bus-error code runs in supervisor mode, and all it does is alter the return address from the exception to point to known "good" code, and, when running on a 68010 or better CPU, clears the "Retry Failing Access" flag in the stack frame (bit 15 of the word at offset 8 for an 010, or 10 for an 020/030) - which is not necessary on a 68000 as it cannot retry a failed instruction.

Disabling the ram test does not hang the computer [a 20Mbyte TT (4+16), TOS 3.05, not-overclocked 68030/68882]

By the time this code runs, the following stuff has run:

```
     AHDI 6.06 (to boot the SCSI HDD)
and then from the AUTO folder
     TT2STHI       (puts TT into ST High rez from ST Low in which it boots)
     unclick       (switch keyclick off)
     Hramdisk  (Hisoft resetproof ramdisc)
     foldr999  (extend folder count)
     amon030       (68030 autoresident debugger [from Devpac 3.1])
     xboot         (boot manager)
     maccel        (mouse accelerator)
     fpufix        (corrects _FPU cookie to show real FPU)
And then my TSR runs.
```

Here is what my code looks like: (In Devpac 3.1)

(Lifted directly from the source. I've just now added comments, however)

(BTW: removing the "illegal" instruction at the start of this code [which is used so that I can single-step through it using the AMON auto-resident debugger] does not alter the problem - it still hangs)

in the main body of the code, whilst in the CPU's Supervisor mode it is called with:

```
     bsr.w    verify_ram_installed

; assumes TT RAM starts at $01000000, and requires 020 or better for TT RAM
; assumes ST RAM is in 512k increments
; assumes TT RAM is in 4MB increments
; CPU has been correctly identified and _cpu variable set prior to call
; assumes called from supervisor mode
;    (movec instruction and access to exception table require this)
verify_ram_installed
     illegal       ; force debugger to pop up so I can step through it

Subject: System call interfaces
Date: 1997/01/25
Message-ID: <11a7cd$312c.1ee@HERMES>#1/1
X-Deja-AN: 212127511
newsgroups: comp.sys.atari.programmer

What is the best way to implement a system-call interface?

Should it be like the GEMDOS/BIOS/XBIOS and have all params passed on the system stack?

Or via a parameter block which must be filled in by the app with appropriate info prior to the OS call? (like GEM AES/VDI requires)

Or is there a better way?

I have been looking at my Toolbox TSR, and wondering if I should upgrade the application-to-Toolbox call interface. (I do this every year or so, trying to smooth the interface, prevent any bugs and so forth)

At present it is structured in much the same way as the GEMDOS/BIOS/XBIOS with a function code on the stack, and (function specific) params following it further on in the stack.

For example, a call to it to get info about the installed CPUs in the computer is as follows: (function "tlbxProcessor")

```
     pea  buffer   ; buffer to be filled in
     pea  $430.w   ; function code
     moveq    #0,d0    ; API - reserved (must be zero)
     moveq    #$10,d1  ; API - magic number (must be $10)
     move.l   d0,a0    ; API - resvd (must be zero)
     move.l   d0,a1    ; API - resvd (must be zero)
     trap #0   ; call the Toolbox
     addq.w   #4+4,sp  ; fix the stack
```

with buffer being (currently) defined as a 12 (or is it 16?) byte buffer in memory, which will be filled in during the trap call.

Now, if I changed the interface to be like the GEM AES/VDI interface, then it would become something like:

```
     lea  buffer,a0     ; buffer to be filled in
     move.l   a0,tptrs+0         ; put it in a pointer array
     move.l   #$430,tcontrol+0   ; function num to control array
     moveq    #0,d0              ; API - must be zero
     moveq    #$11,d1            ; API magic (must be zero)
     move.l   d0,a0              ; API - must be zero
     lea  tglobal,a1         ; API pointer to parameter block
     trap #0            ; call the Toolbox
     ...
```

with tglobal being set up like:

```
tglobal:
     dc.l tcontrol  ; control struct (func numbers, ap ids etc)
     dc.l twords        ; 16 or 32-bit integers
     dc.l tsizes        ; sizes of items
     dc.l tpointers ; pointers
     dc.l tfloats       ; floating point values
```

and then each of tcontrol, twords etc would need to be defined and allocated memory space for the largest possible requirement, irrespective of whether the task at hand actually needs that much or not.

As far as I can see, there would theoretically be less stack usage with the second form, but potentially a larger memory footprint due to the globally allocated arrays being possibly larrger than needed.

And the second form would be slower to handle, as one would need to indirect through the parameter block to get at the data, whereas the first way has the data on the stack ready, and one merely has to pluck it

straight from RAM without an indirection slowdown. (This indirection is
less of a hassle on 020 and better CPUs, but it is still slower than just
plucking data from the stack directly)

Is there a specific reason that the GEM AES/VDI call interface was
implemented differently to the GEMODS/BIOS/XBIOS call interface?

And, is there a better call-level interface that could be implemented?

I'm not sure I understand the issue. Are you saying there's no way
for an application to iconify itself? What do you mean by "actively
iconify a window"?

>Also, many applications don't support iconify all, so if someone
>control + clicks on the smaller a slot gets reserved, but no

Don't you just normally click (not control-click) on the smaller button
(the button to the left of the "maximize" button)?
And besides, the smaller button doesn't normally appear on applications
that don't support the iconifcation, right? I've never seen it on, say,
my Prospero C editor. But I do agree that it would be nice if you could
iconify applications that don't explicity handle iconification.

Final Notice: IEEE's COMPCON 97 Set for Feb. 23-27 in San Jose

Visit the COMPCON 97 World Wide Web page for more information and/or to register:
URL: http://www.compcon.org

or read the following :)

SAN JOSE, Calif., -- One of the country's pre-eminent computer technology conferences -- Compcon 97 -- will be held February 23-26, 1997 here in the heart of the Silicon Valley. This continues a tradition of more than 40 successful years in the San Francisco Bay Area for this non-profit technical conference.

"Hot Systems/Cool Software" is the theme of COMPCON 97, underscoring the importance of new computing technologies and applications in both the computer industry and society.

"Computer technologies ranging from world-record 600MHz processors to eye-catching Java applets and VRML virtual worlds will all be featured at COMPCON 97," said Darrell Long, the conference chair and computer science professor at University of California-Santa Cruz. "COMPCON has the reputation as a one-stop, no-hype overview of the important developments in our industry. If you could only attend one technical conference a year to learn about the overall state of the industry, COMPCON would be your choice."

Adds Dr. Joel Birnbaum, Vice President, R&D and Director of HP Labs: "COMPCON has been consistently a valuable conference presenting a broad technical program on state-of-the-art computing technologies."

IEEE COMPCON 97 will be held at the San Jose Hilton and Towers Hotel (300 Almaden Blvd.) in downtown San Jose, Calif.

COMPCON is sponsored by the Institute for Electrical and Electronics Engineers (IEEE), a non-profit professional association, and has been held in the Bay Area annually since 1955.

Its 27 technical sessions and six in-depth tutorial topics run the gamut from the design of advanced central processing units and networks to computer systems, advanced programming and world wide web technologies. In addition, five well-known industry luminaries will give plenary talks. COMPCON has no marketing presentations or product exhibitions.

COMPCON 97 program overview:

INTERNET/INTRANET TECHNOLOGY: Trends, Environments, Applications

SYSTEMS: Superservers, Mobility, Software Architecture

MICROPROCESSORS: High-Performance, Low-Power

INTERCONNECTS: Parallel Computers, LAN and WAN, Wireless

VIDEO: Advanced Displays, Digital

MULTIMEDIA: Technologies, Software Environments, Applications

PARALLEL/DISTRIBUTED SYSTEMS: Applications, Hardware, Compilers

OPERATING SYSTEMS: Object-Oriented, Microkernels

PERIPHERALS: Mass Storage, DVDs, Display Technologies

EMERGING TECHNOLOGIES: GigaHertz Devices, Advanced Hardware, Java

Tutorial topics include: 3-D graphics, virtual reality, web site design and security, advances in computer architecture.

Plenary speakers include:

Federico Faggin (Synaptics) -- "The Microprocessor: Its History and Future"

Hector Garcia-Molina (Stanford) -- "Meta-Searching Across the Internet"

David K. Gifford (MIT and OpenMarket) -- "The Future of Electronic Commerce"

Ted Laliotis (Laliotis and Associates) -- "To Tax or Not to Tax Internet Transactions"

Dave Nagel, AT&T

Advance reservations to Compcon 97 can be made through the web site or by contacting:

Dave Hunt, COMPCON 97 Registrar
Lawrence Livermore National Lab
PO Box 808 MS L-130,
Livermore, CA 94551-0808

Eeerm did I miss tutorial number 5? it hasn't passed through here? or am I jumping the gun ?....the C thread has died and the tutorials stopped, in fact the whole newsgroup has gone dead, ? surely the knitting class hasn't got to you all ? :)

Hello! anyone there ? :)

Cheers.....!ynoT

Please don't keep posting replies to this message to inappropriate
newsgroups. (see your header). It should really only go to groups
that are interested in PC programming, and not any of the following:

comp.sys.acorn.programmer
comp.sys.amiga.programmer
comp.sys.atari.programmer
comp.sys.apple2.programmer

I'm a little dubious about some of the other groups in the list also.

Send away. I have both Lattice C 5 and GCC 2.5.8, and am literate in
both. I should be able to fix it.

That's a bit unfair. It's iconification support is OK... even
under bloatware like Windows, iconification is handled largely
by the program in question.

The best way is to use appl_getinfo(). This function exists if
you find that appl_find("?HAGI") (I think) returns something
other than a failure code (which I guess must be negative).

A much better way to recover from the bus error in such a routine is to
save the SP before running the test and to restore it in the bus error
handler before directly jumping back to continue with normal work. No
need to muck around with the exception frame, instead just throw it away.

Hi,

I'm trying to make contact with the SCSI-port
on my Falcon. This little program bombs out
with two bombs, why?
I'm using the data-adress that the Profibuch
tells about the TT.

I have used Lattice C ver 5.something.

```
//scsi.c
//To make contact with the scsi-port
#include <stdio.h>

unsigned char GetData()
{
     char string[64];

     printf("Please input 8-bit value (0-255): ");
     gets(string);
```

```
     return((unsigned char)atoi(string));
}

void WriteData(unsigned char val)
{
     //I have tried 0xff8781 with the same result
     unsigned char *data=(unsigned char *)0xffff8781;
     *data=val;
}

unsigned char ReadData(void)
{
     unsigned char *data=(unsigned char *)0xffff8781;
     return(*data);
}

void ShowData()
{
     printf("Value in scsi-data: %d.\n",ReadData());
}

void main()
{
     long super=gemdos(32,0L);

     if (gemdos(32,1)!=-1) {
          printf("Not in Supervisormode.\n");
          return;
     }

     ShowData();
     WriteData(GetData());
     ShowData();

     gemdos(32,super);
}
```

I think the easiest option is the following:

a) Go into supervisor mode
b) Save stack pointer
c) Save Bus error pointer
d) Change the bus error pointer to your "x" (explained later)
e) Make your memory check
f) Restore bus error pointer
g) Restore Stack pointer
h) Enable interrupts
i) Go back to user mode

The estructure of your code must be:

```
Steps a-e
jump to "Y"
"X": Here goes your bus error handler. Your don't need to restore
     stack pointer and things like that. All you need is to save
     your top of memory
     Falling throught
"Y": Steps f-i
```

This system is used in TOS.

BTW, STE chipset doesn't give Bus error when you access to an addr
beyond physical end of the memory. It just wrap.

I think your best choice might be to have a look to TOS reset code. It's
very lightning.

Let me know your progresses. Good luck.

I recently purchased Devpac 3 for the Falcon 030.
I think the version is 3.10 (I don't have it in front
of me at the moment).

Does anyone know if this is the latest version or if
I need to get some updates from somewhere. I think I
remember seeing some files on UMICH that were about Devpac.

I also bought Devpak DSP for the 56k. Do I need anything
else to write code for 56k?

Thanks again,

Brian

gmiller@inca.co.nz (Gaven Miller) said:-

>Is there a specific reason that the GEM AES/VDI call interface was
>implemented differently to the GEMODS/BIOS/XBIOS call interface?

I can think of three possibilities, and they all reinforce each other so it seems reasonable to me ... ;-)

Firstly, some Gem calls pass a lot of variables so there's less stack overhead with arrays.

Secondly, you have the possibility for the calling code to just change the array addresses between calls - could end up faster than repeatedly stacking and unstacking lots of data which has not changed.

Thirdly and probably the most important, the interface is pretty flexible. Atari used traps, maybe the PC used another calling method like a fixed address (a complete guess there), and if Gem had taken off bigtime then a "stackless" machine wouldn't have any problems either.

>And, is there a better call-level interface that could be implemented?

Dunno. A linea type interface _might_ be more efficient. It depends on the calling code really - and how tricky it would be to hook into it!

Luckily all these problems only exist in AES 4.1. Other AES versions (e.g.
N.AES, Geneva...) don't have these problems. In those cases you can iconify
a window without the user having clicked on the smaller, and slots are only
reserved when the window actually is iconified.

Does anyone out there have any details on how to call and use the Brainstorm
JPEG Decoder?

TIA, Gary

I am not sure about Pure C 1.1, I don't have that, but in Pure C 1.0, you can define your own GemDOS/XBIOS calls by using one of the following low level builtin function calls: gemdos(), bios() or xbios(). With these, you can define any calls you want.

Regards
William

It quite easy actually but relatively more difficult than using a line by line
output like printf(). Basically, you will need to know the location or
coordinates of where you want to draw. So there briefly what you do:
  1/ decide where to draw in xy coordinates.
  2/ decide what you are going to draw - text, box etc.
  3/ use one of the many vdi drawing rountines to draw it - depending
     on what you want to draw
     eg in drawing text, you will pass the following items to the function:
         x, y locations and the text to draw.

  Sorry but I cannot remember the functions name...
  (I mix up my Atari & VC++ functions calls anyway).

Hi!

In article <avg.854114934@news.cwi.nl>,
     avg@cwi.nl (Annius Groenink) writes:
> [Iconify worthless?]
> What makes it worthless is that you can only iconify if the user
> clicks the SMALLER. There is no way to actively iconify a window.

Not true. Atari post-documented a way to iconfy a window "by code". IIRC it was wind_set(win, WF_FULLXYWH(?), -1, -1, -1, -1);

> Also, many applications don't support iconify all, so if someone
> control + clicks on the smaller a slot gets reserved, but no
> icon appears. The slot will be empty until you reboot.
That's a bug in Atari's MultiTOS. Clever(er) implementations (like the ones found in N.AES or MagiC) don't create such empty slots.

Ciao

Thomas

Hello everyone,

Have you ever heard of Glasnost? It is a game programming language that I am currently developing. It is freeware. For more info, visit

http://www.lysator.liu.se/~kilsmo/glasnost.html

There is now a Glasnost Mailing List:

Address: game_lang@lysator.liu.se

To subscribe, send an e-mail to game_lang-request@lysator.liu.se, with subscribe as subject.

To unsubscribe, send an e-mail to game_lang-request@lysator.liu.se, with unsubscribe as subject.

Subscription is not automatic, so it may take a little while until you are on the list (maximum 24 hours). You will get an e-mail that confirms that you are on the list.

Any questions, mail to kilsmo@lysator.liu.se

Nicklas Larsson

try to get the freeware VDI-Enhancer (enhancer.zip?) by Behne+Behne (NVDI),
which enables VDI to use offscreen-bitmaps (without buying NVDI).
It oftens come with the game "`Ballerburg"⊠ and has an nice doku, wich
describes, how you can make use of "`extended"⊠ VDI calls, which enhancer.prg
provides. This mechanism works for every other enhancement (if you have one

;-)

Hope it helps,

Martin

I appreciate that this wasn't your fault, Barry, but Geoff was just pointing out, albeit a bit sarcastically, that users of c.s.acorn.p, c.s.amiga.p c.s.apple2.p and c.s.atari.p are not neccesarily the most appropriate people to answer questions about M$ programming languages. Indeed, most of us frequent these groups because we want to have as little as possible to do with M$ specific programming.

Chris.

That depends largely on how many parameters need to be passed. (One
can also pass parameters using registers.)

And what if it was launched after the multitasker had started?

For example, if it is run via an "INIT=MAKEJAR 300" line in MINT.CNF?
(I've known some people to do such things, even though the apps placed
into INIT= lines can often be monotasked before MiNT).

And that the processor is given to another task quickly thereafter, before
it has had time to fully initialise?

Messing with the basepage will prve fatal if the OS has stored important

info there before the task switch when it tries to switch back.

(Yes, I know that GENEVA is a co-operative multitasker, and wont switch
away until you give it permission to (via an evnt_???? call)

It sounds as if you're causing a double bus fault; this happens
because; are you sure "Retry Failing Access" doesn't have
negative sense? The other thing you should check is that your
return address on the stack (and equally your status register)
are correct. If the stack pointer were to point to the wrong
place, you would almost certainly double fault the CPU - and on
almost all CPUs, a double bus fault puts the processor into a
sort of halt mode, where it doesn't even bother trying to execute
instructions.

Subject: GEMulator FAQ in the making

Date: 1997/01/29
Message-ID: <N.012997.111700.14@wxs4-8.worldaccess.nl>#1/1
X-Deja-AN: 212962684
organization: World Access, Internet, E-mail and Videotex
newsgroups: comp.sys.atari.programmer

Hi there, and sorry for the cross-posting...

GEMulator is an Atari ST emulator for PCs. The creation of a newsgroup is in the making, although limited to a planning stage at the moment. I am currently setting up a FAQ file, and I would like to request everyone who has fixed any of the problems he ran into to write them down (including their solutions) and mail me at my private email address. It looks like the first version of the FAQ will primarily be questions (so you're welcome to ask questions that you don't know the answers to, too), but I'm sure we'll get there in the end.
If you want to be put on the GEMulator FAQ mailing list, please email me with a subject of "sub GEMulator FAQ list".

If you want to have a look at some of the problems *I* am having with the GEMulator...

1) "ST Zip" won't work. It cannot write (deflate) anything; it gets write errors on the hard disk. Can this be fixed?

2) Can "FastCopy Pro" be made to work? I tried to copy a disk (this had readable directories and folders) and, although FCopy appeared to work fine (albeit slow when writing) the target disk had 0 bytes used, and no folders either.

3) "Revenge Doc Displayer" refuses to be installed properly. How come?

4) "Freedom" seems not to work; the file selector seems unable to let you save a document that already exists, although it does update the time stamp.

5) "Xboot" sees folders double and can't find its own "c:\XBOOT\" path. Suggestions?

6) "Ledpanel" doesn't work.

7) I tried installing Geneva and Neodesk 4 on the GEMulator. Neo4 seems to work just fine. Installing Geneva goes fairly OK, but it can't use Neo4 at the same time. I think the problem is the following: To autoboot Neo4 from Geneva (as a shell), Geneva has to read the specs from GEM.CNF. And the GEM.CNF is always 0 bytes after installing it on GEMulator...

8) The GfA Basic compiler "MENU.PRG" screws up compiling. I fixed this problem...a solution will be in the FAQ.

9) A failsafe way to check the write-protect status (on any Atari, any TOS version) won't work on GEMulator. How can one check this now?

That's it...I hope there'll be lots of response.

I have two AV_PROTOCOL documents, one specifies finding the name of the AVSERVER environment variable. Is shel_write(8...) the way to get this, or a simpler way.

Also, how can I test this using single-TOS (4.04). If seems like I need Magic or MultiTos to check it out.

Thanks in advance,
John

peek($fffffc02) gives the scancode of the last pressed key. You have to read the adress in Supervisor mode, in Gfa it's called speek() if I remember right, numbers 0<x<128 are scancodes for pressed keys, the same code + 128 is the realease code for the same key. Warning: when the mouse of a joystick is active a special mouse or joystick packet is send to the same adress, you can't distinguis between mouse or joystick packed data.
But ehh... doesn't inkey$ the job?

Bye, Hans Wessels

Bconin()

>> I know that the Atari ST has double debouncing so it would only be
>able to return the scan code for the last key that was pressed, but that
>will be fine.
>> I can call a function to return a value for the shift, control, etc..
>keys without any problems using one of the XBIOS routines. I would like a
>similar function for the other keys.

Rather than use Kbshift() - get Bconin() to return the shift bitmask
in bits 24..31 by toggling bit 3 of conterm (byte at location $484).
This saves them getting out of sync.

>> I have tried using other XBIOS routines relating to keyboard
>detection, but they all seem to use a keyboard buffer. This means that it
>returns the last key that was pressed, and not necessarily the key that is
>being pressed at the time.

Avoid this problem by disabling keyboard repeats - clear bit 1 of
conterm to do this. Just in case the buffer has chars in it before you
start, flush it via WHILE (Bconstat(BC_CON)) DO Bconin(BC_CON);

>> I need to be able to tell if a key is being pressed or not being
>pressed at the time the function is called.

Having done the above initialisation the test is simple ...

IF (Bconstat(BC_CON)) THEN key = Bconin(BC_CON);

.. the asci code is in the low byte of the low word of 'key'. The
scan code is in the low byte of the high word, and the Kbshift() bits
are in the high byte of the high word.

>> I managed to find a memory location (521 bytes after the keyboard
>buffer, I think) on my 2meg STE that does the trick: When a key is down

>the memory location hold the scancode for that key. When no key is down
>the memory location holds a null byte.
>> I can call a function to check the value in this memory location, and
>therefore detect which key is being pressed, if at all.
>> This memory location varies for different TOS versions and different
>machines!

oo-er! ;-)

>> I believe there must be a command in BIOS, XBIOS or GEMDOS (or
>something else) that will allow me to detect a keypress without using a
>keyboard buffer or repeat/delay rates etc..
>> ..or there may be some way of finding out where the memory location
>(holding the scancode) is for the machine that the program is running on.

It would be a lot of work to get access at a lower level - keyboard
processor interrupts, buffers and suchlike.

> I program using GFA basic, but I should be able to call BIOS commands
>that other languages use. If anyone could help me I would be very
>grateful. Thankyou.

There is another alternative - use the VDI. I had the urge to go see
how difficult it would be and was pleasantly surprised to find it was
trivial, especially considering I've never used the VDI input calls
before! ...

```
#define  DEF_VDI
#define  DEF_VSF_INT
#include <gem.h>

main()
{int wki[11]  ={1,1,1,1,1,1,1,1,1,1,2},
     wko[57],
     vh;
 Rect    nowt;
 int xy[4];
 uint    k;

 appl_init();
 vh = graf_handle(PRECT(nowt));
 v_opnvwk(wki,&vh,wko);

 /* completely pointless red box ... */
 vsf_interior(vh,VSF_INT_PATTERN);
 vsf_style(vh,4);
 vsf_perimeter(vh,TRUE);
 vsf_color(vh,RED);
 v_hide_c(vh);
 xy[0] = xy[1] = 0;
 xy[2] = wko[0];
 xy[3] = wko[1];
 v_bar(vh,xy);
```

```
 v_show_c(vh,TRUE);

 /* the relevent bit ... */
 /* enter sample mode ie dont wait for input - return immediately */
 vsin_mode(vh,3,2);
 do  {
     printf("\033H\033K");  /* yep, lets mix console and graphics! */

     /* if keypress print scancode and ascii code */
     if (vsm_choice(vh,&k))  printf("0006",k);
     /* shift etc test [vq_key_s()?] omitted */

     printf("\n");      /* easier than fflush(stdout) <G> */
     evnt_timer(100,0); /* so we get a chance to see printf()! */
 }while ((k & 0xff) != 13);
 /* ... end of relevent bit */

 v_clsvwk(vh);
 appl_exit();
 exit(0);
}
```

No. To put it simply.

In more complicated but less subtle phraseology: No.

To rephrase another way; No.

Basically, you can't do it. AND DON'T EVEN THINK ABOUT OPENING
A PHYSICAL WORKSTATION YOURSELF; YOU'LL CAUSE ALL SORTS OF
PROBLEMS (most likely, anyway).

Do it just the way you are doing it at the moment, and you'll be
fine. OK - so it's complicated, but have you ever programmed
Windows(TM)(R)(whatever other letters are after it at the moment)?
Windows is *really* complicated. And when I say *really*, I
mean *REALLY*. ;->

Of course we need it.

As we all know, Atari programmers are really Windows PC programmers.

And, of course, the name of this newsgroup ("comp.sys.atari.programmer")
is just another Microsoft secret invention (shortly after Bill Gates
created the Internet) for housing the best Windows programmers and keeping

them away from the know-nothing rabble - like Microsoft programmers.

getenv("AVSERVER") should do the trick. I don't think you need any special
TOS-version to use this.

The screen workstation has already been opened, and the handle can
be obtained using graf_handle(). Calling v_opnwk() again will
probably crash.

Yup, Get mint with minix or magic with VFAT.
That will work. bye :)
However the desktop from thr ROM can not display the longfilename
correctly.
You woudl need an alternative desktop.
However Magic comes (I believe) with it's own desktop.

>
> So, how do I open a VDI workstation from within the AUTO folder? And, if

I'm not completely sure if VDI is available from within the AUTO folder,
but I guess so. You simply open a workstation (not a virtual one !) for
the screen, and you can draw using this handle. You must have closed it
again by the time the AUTO execution is finished, otherwise AES can't
open their screen workstation.

> so, can I leave it open through a Ptermres() call? (So I can use the

No, see above. There is not way to tell the AES to open a virtual,
instead of a 'real' workstation.

> stored handle in my VDI redraw routines in the plug-in as called from the
> main app)

Yes.

> functions in the plug-in to be used for redrawing (ie within a G_PROGDEF
> object)

You can make your code be a Ptermres program, which only initialises the
most basic stuff, but not the VDI. Then make an accessory (better : a CPX
module) to call the init routine automagically after the AES have started.
I guess you'll need some user settable variables too, the accessory or CPX
is the perfect place to let the user enter them. The init routine then
opens a virtual workstation just like you're used to do.

> And, of course, when the prog exits, it has to call a de-initialisation
> function within the plug-in.

Not needed with a Ptermres solution, like the one I suggested.

Cheers Peter

Why should it be closed and reopened ? From my experience it works
perfect if only the wind_set is called !?!

Well, you could either get Magic which uses the Windows 95 VFAT filesystem
(crap, crap, very crap) or you could get MiNT with Minix and have a proper
filesystem which is very, very fast. Both offer long filenames. Magic costs
money, whereas MiNT and Minix can be downloaded from any good Atari FTP site.

Cheers,

James Cox.

A PC under dos or BIOS uses traps, though they're called 'software interrupts' and the instruction (in most high-level languages) is intr or dosintr or intr86.

I _think_ windows uses a different method, but I never could figure it out.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:

*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:

*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

Here's an idea:

If anyone out there can code the DSP and has knowledge of GIFs, how about writing a GIF DSP decoder (along the same lines as the Brainstorm JPEG one, ie. a TSR).

This could then quickly become a standard (like the jpeg one) and I'm sure applications such as CAB and GemView etc. could be changed to support it!!

So, how about it anyone?

Regards, Gary

I tried it under MagiC and Ease just for the hell of it ... the
program itself worked ok although the whole system froze after it
terminated - not surprising really! ;-)

Thanks for your response.

I was referring to something loaded during the boot phase (ie from the
AUTO folder).

From what I am led to believe, GEM AES funcs like graf_handle are not
avaialable until after the AUTO folder has been scanned.

In the Auto-folder, it's no problem to open a physical workstation (but you
must close it on exit). Many boot selectors do so to allow the use of the
mouse.

Ciao

Thomas

Excelent! I have been waiting for one of these for ages! :-)

>anyone tell eme where to get and overview and more indepth spec of the
>falcon audio?

I have example 680x0 and C code for playing samples on the Falcon using
the appropriate XBIOS calls on my WWW pages. I haven't detailed how to
do it directly accessing the hardware, but this is quite simple once you
know how the OS calls work (the hardware is the same thing - just not as
nice an interface, and quite a bit faster).

The programming pages are at:
   http://www.cs.man.ac.uk/~jacquesa/programming/

I haven't (yet) got any info on MIDI, but I might add some (mail me if
you are interested in this).

> Also any advice on a good 68030 reference book. Cheers.

well, a good DSP book might be of more use... :)

Anthony

What about programming your plugin using an Accesory, instead of an Auto
Program?.

Hi

I use a version of GNU Tar made by a guy called Alan Hourihane, because it works with the Tapebios package (also his). This version is Tar 1.10.

It worked really well, allowing me to backup files to a Tar archive, which was easily read by another computer..

Problem; if I attempt to backup more than (approx) 100 MBytes it crashes.

It causes a Bus Error, the PC has a value like 677A004E, which AIUI, is way above the addressing space of the 68000.

Does anybody know any reason why, like is there a maximum file size on the ST under TOS 1.04 ?

Is this a symptom of Stack underflow/overflow ?

The problem can't be the Tapebios driver, as I can create disk images of 250 Mbyte disks.

The crash happens under TOS or MiNT (1.12.6 or 1.14).

Machine is a 4 Mbyte STFM, TOS 1.04.

Does anyone know of a good 'postmortem' program that displays the registers etc. after a program has bombed ie. RAM $380 - $3EB!

It must work under MagiC.

TIA, Gary

That'd be BCF FORTRAN. I know people who've used it successfully for some jobs, but I use Prospero. I wrote an article on the subject for ICTARI.

Get thee to:

http://www.elis.demon.co.uk/ictari/ictari.htm

And download issue 40, which also contains the BCF compiler. Issue 41 has the GNU FORTRAN to C converter, which is also meant to have some limited FORTRAN 90 support. I posted this earlier but Demon ate it...

Have Fun,
"Augeas"

>If anyone out there can code the DSP and has knowledge of GIFs, how about
>writing a GIF DSP decoder (along the same lines as the Brainstorm JPEG one,

I've thought about this, but I very much doubt that there would be any
major performance advantage over a good CPU decoder. The DSP is not very
good at the bit manipulation you need to do when unpacking GIFs and then
there's the small memory to worry about.

>This could then quickly become a standard (like the jpeg one) and I'm sure

Even if the GIF decoder ran on the CPU it could of course use a similar
concept as Brainstorm's JPEG decoder. The reason noone has done this is
probably that a reasonably good GIF decoder is small and simple to write.
(Naturally, a really good one is not quite as simple to do. ;-)

>applications such as CAB and GemView etc. could be changed to support it!!

I think what we really should have is something similar to the Amiga's
'datatypes'. Any program that supports them can load any file type that
the user has a 'driver' for (if I've understood matters correctly).

>So, how about it anyone?

If there hadn't been the Unisys patent on the LZW algorithm (used in GIF)
to worry about, I might've done something with my code from MGIFv5 (I've
not seen a faster GIF decoder than the one in my latest v5.10beta), but
right now it looks like I'll have to disable GIF support in the next
release version... :-(

Perhaps there's some anonymous guy from a country where software patents
can't be filed who'd like to give it a try? ;-)

Can someone help? I am writing a new GEM-based VT100 telnet for stik. (a beta is about to be released.) I just found some bitmapped GDOS compatible fonts that have a full VT100 set, including the pseudo graphics chars. How do I load them into a program, without using GDOS or equivalent. I have nvdi 4.0, but want to write the prog. for all Ataris. The Lattice manual sorta impies that I need GDOS to load them, but I got these from an old program (circa 1988) that didn't use it. How do I do it without distributing some Gdos with the files???

HEEELP!!!

<snip>

Thanks a lot! :)

A couple of minor points I discovered (yes it does work - it tried it last
night).

* Geneva (005 demo run as a MiNT AES) doesn't support this, and it allocates
  an empty slot and looses the window. However, N.AES/AES 4.1 do support this.
  Iconify is broken in both XaAES and oAESis atm. so I didn't bother testing
  it with them. :)
* When you recieve the WF_UNICONIFY message, you will get -1,-1,-1,-1 as the
  position/size of the window, so you will need to have a way of restoring it
  to the correct position (put it in the wind_set(...WF_UNICONIFY...) call).

Does anyone know if it works under Magic? (it doesn't really matter, as magic
doesn't even 'have' iconify, as it is < AES 4.0 and appl_getinfo shouldn't be

available < 4.0 so you cannot check for its presence...)

Ehhh... what do you mean with this? MagiC does have iconify and appl_getinfo should be available. Why its not truely AES 4.1 compatible and report 3.99 as AES version I don't realy understand either. It wouldn't cause to much work to make it support AES 4.1 fully and it would make me happier.

Andreas Kromke should know.

We sure have, but it can't hurt to talk about it again. :-)

The VDI can do the above, and more, easily. :-)

Hmm - just wondering if I sent you some sources called LINEAX or
something similar. I certainly hope so because I've lost them and I
wonder if you still have them?

If you do look for a file called _lx_lfnt.c which contains all the

information on loading and processing a bitmapped gdos font.

I know I sent the source to somebody!

Hello...

I'm writing a little clock program using SozobonX C, and I've come across a little problem. I've got the clock itself to work perfectly; the hands will move around the face and so on, but I can't get it to do so if I put it in a window and check for window events (movement, clicking on the close box etc). The evnt_mesag command seems to stop everything, until something happens, at which point the clock changes to the correct time.

Is there a way of checking for events without making the whole program come to a halt? I have put the offending piece of code below.

```
     while (boolean){
          time (&rawtime);
          time_struct = localtime(&rawtime);
          evnt_mesag(msg_buf); /* <---- The problem's here! */
          switch (msg_buf[0]){
               case WM_MOVED:
                    /* Lots of code here... */
                    break;
               case WM_CLOSED:
                    quitflag = FALSE;
```

```
                    boolean = FALSE;
                    break;
          }
          if (time_struct->tm_sec != seconds){
               boolean = FALSE;
          }
```

Any ideas on how to fix this? I thought a tiny clock program would be easy to write, but I'm stuck, and I haven't even got on to the window clipping yet... :-(

Thanks for any help...

Adam Foster

>   HEEELP!!!

From=20the premere issue of STart, pg 42:

The following technique will let you load and use alternate fonts without=
=20

using GDOS. Your font must be in the standard format (including header)=20
as defined in the VDI manual. Either compile the font into your=20
application, or load it from a file at run time.

Instead of doing the normal vst_load_fonts call, you will alter your=20
application's control array directly. Control words 7 and 8 must be a=20
32-bit pointer to the font. Control words 10 and 11 are a 32-bit pointer=20
to a scratch buffer which will be used by the VDI when doing special=20
effects such as bold or italics. Control word 9 must be set to the length=
=20
in words of this buffer. The buffer should be at least four times the=20
size of the largest character in the font.

After setting up the control array, you should be able to select the font=
=20
using the set_font function. When you are done with the font, or with=20
your program, do a regular vst_unload_fonts call so the VDI doesn't=20
continue to think the font is available.

(thanks to John Feagens of Atari for this information.)

A list of all the cookies that all the various programs that exist install.
PROFILE 2 (about from masses of other data it reports) will give a
description of every cookie it finds in the user's cookie jar. Also, for XBRA
and XNAM IDs.
I've now got an up-to-date XBRALIST which is not bad but stil has some
missing which I'm working on.

Subject: Dlock() prevents Fsfirst()/Fsnext() from working correctly?
Date: 1997/01/14
Message-ID: <1e7cd$12e2d.190@HERMES>#1/1
X-Deja-AN: 209652321
newsgroups: comp.sys.atari.programmer

As part of a filename validation app that I wrote to supplement the
CD-writer software Brian & Mario Becroft <mbecroft@tos.ak.planet.gen.nz>
use when creating CDs (which has a very tedious "you have to exit the app
to change/correct a failed filename" problem), I have run up against a
problem when making my app (which searches and validates filenames against
some simple rules, and then allows the user to correct any "failed"
filenames) a bit more MiNT friendly.

Whilst my app runs OK without fouling itself or the disc it is checking,
when I use Dlock() prior to enumerating the directory structure with
Fsfirst and Fsnext, the search reports "zero files" searched on the disc,
even though there are ~2000 files on the drive. Removing the Dlock call
gets the correct results.

Changing the search to any other drive (such as my old Megafile 60, which
has not really been used for aeons, and had no active ["open" or "in use"]
files on it at search time) also gives the same failure.

(I am using Freemint 1.14, Memory-Protection 'on' and AES 4.1, on a 20
Mbyte RAM TT. I have just under 1 meg of ST RAM and about 8-10 megs of TT
ram free at app run time. The app was flagged to Load and Malloc from TT

ram. Switching protection off produced the same [bad] result).

It operates exclusively in the TOS domain, on GEMDOS 8+3 filenames.

Here is roughly what my source looks like (in Lattice C 5.60) (configured as intsize = 32-bit, target CPU = '030). I've snipped the surrounding GUI code, and the code that sets the basepath to be searched, and I assume you are all prescient enough to know what I mean by my redefined data types like "uint32".

The search code will recursive search any directory it finds in the search path, even though the source I present here doesn't show this. (I've set my stack to something like 64k, even though the worst case I've seen it only needs something around 48k or thereabouts [each recursion uses about 800 bytes of stack space])

-- BEGIN Source Code Snippet --

```
typedef enum  { ... } Reason;

extern uchar8 basepath[255+1];

XATTR xattr;
uint32 mintcookie;
uint32 err;
uint16 count, failcount;
struct FILEINFO finfo;

mintcookie = 0;
if( getcookie( 'MiNT', &mintcookie ) && mintcookie > min_version_ver )  {
     Fxattr( 0, basepath, &xattr );
     Dlock( LOCK, xattr.dev );
}

count = 0;
failcount = 0;
err = Fsfirst( "*.*", 0x3f );
while( !err )  {
     Reason reason;

     count++;
     if( !validate( finfo.name, &reason ) )  {
          fail( finfo, reason );
          failcount++;
     }
     err = Fsnext();
}

sprintf( alert, "[1][%d files searched|%hd failures][ ok ]", count, failcount );

if( mintcookie > min_mint_ver )
     Dlock( UNLOCK, xattr.dev );
```

Harry,

I have no problem with you selling Lynx stuff but knock off the racist Canadian comments, will ya? I'm sure you wouldn't like us to start proclaiming that Americans are all obnoxious assholes would you? (That would be silly because I have met many great friends over the years who happen to come from the US)

Hi!

Does anybody know where I can find information on the new/extended AES-calls in AES 4.0/4.1? And are there any free libraries for Pure C (I have 1.1) that supports these? Maybe my current libraries has 4.0/4.1

support, it supports appl_search() although it's not mentioned in the
helpfiles.

I have to say that the price you want for these units is very steep.
They may have cost $5000 originally, but it wasn't that long ago that
286's cost that sort of money, and you can't even give them away now.
It's an unfortunate fact that computer equipment devalues hideously
quickly, and obsolete equipment is worth almost nothing. The units you
are selling aren't even new. Half price may be reasonable for
second-hand units for a CURRENT product, but the LYNX is effectively
dead. No more are being made. Atari in effect no longer exists. There is
therefore no hope of marketing or advertising support for any new Lynx

related product. Also, what if the thing breaks down? They are full of custom chips. What hope of getting spares? This is a very risky investment!

$2000 may not be much to a professional developer, but how many professional developers are really going to be interested in the Lynx? Can you HONESTLY make a livable income writing Lynx games?

In my opinion, the only people who are likely to be interested in the development units are tinkerers, like myself. I would be very interested in obtaining a development system, but not at this price. The price would have to be about a quarter of what you are asking for me to consider it. If you find you can't sell the units, and are prepared to drop the price, then contact me.

My offer isn't going to get any higher...Sorry.

Lionel...

A comparison is in order here:

A third party Jaguar dev kit is approx 300.00 (uk).

An SNES third party dev kit is around 350.00 (uk).

The Sony Yaroze Playstation home dev kit is 550.00 (uk), and includes
rather a lot of stuff for the money - assembler, C compiler, debugger,

developer PSX, libraries, documentation, free Pipex account, 3d
object creators, graphics convertors, loads of utils, etc. Available
direct from Sony only.

I could quote retail on a full-blown pro Playstation dev kit, but my
licensing agreement with Sony prohibits it - all I can say is that
it's a bit more than that ;)

Datel were selling a system that would stand in for a full blown
dev kit for around the 200.00 (uk) mark.

I can say what 3rd party pro-dev kits for a Saturn cost, and it's
around the 5000.00 (uk) price by the time you've bought everything
you need.

I think, on reflection that the $2000 for a Lynx dev kit with no real
probability of a market for product from it is a bit steep.....

I've got a Vectrex dev system that I put together myself
- bet there's even less of a market for that, but I know of at least
three new games that have been released just recently. Fact is
that folks only do old platforms for fun and nostalgia now, and
$2000 is just to much (I used a Crash Barrier EPROM emulator
and a dismantled cartridge to build the Vectrex dev unit in case
anyone is interested - just to prove to a guy in the office that
it could be done).

Much better call is for folks to sign up to the Yaroze project
on Sony - it's cheaper, you get more for your wedge and
you get a crack at the wider world if you produce something

worthwhile (license it to a big boy like Psygnosis). Or do it
for a better reason - fun, and a chance to face off against
the best of the amatuar game dev fraternity from Japan &
Europe.
UK delivery of Yaroze kits is february, US launch should be
some time after that - we finally get something first ;)

Craig Graham.

Which comes first, getting the facilities to produce, package, and
market a game? or selling it?

We have hundreds of EPROM cards in stock waiting for the software to be
done. We have dealers who are ready to distribute anything we write.
We are working on getting boxes and manuals made that look like the
ones that Atari did (as opposed to what Telegames is doing). We have
the EPROM programmer and EPROMs (and I'm ordering more EPROMs today).
The only thing we don't have is a "track record", but I don't need one
to offer these services.
    For example, if Carl Forhan wants us to make 200 Pong games
and sell them, we could get it done in short order.

    If anyone buys a Howard board from us, writes any kind of
game, and needs facilities to sell their game, we have it.

repeat sales pitch

Only $2000 buys you a Lynx business opportunity - not a toy or a
collector's item. Call (612) 462-2500 to order one.

****
Watch this space for new Lynx games currently in development by
Carl Forhan, Bastian Schick, and myself.

This is NOT a vaporware announcement.

Wrong, <20USD !

Tell me, does one of these dev.kits provide real debugging ??
With a Howard board, you have a Lynx where you can access nearly every
single register.
I think the N64 dev. kit is the only one giving you this feeling.

I hear "Virtual Bob" has this feature.

But, unfortuantely, you need four braincells to use it.

(Pity it's target audience only have two-and-a-half braincells in total)

FLOPPY COMPAIBILITY

Can I stick a PC formatted disk in an ATARI ?

And most important, can I read midi files (programmed on PC) eventually ?

Thanx in advance to anyone who knows the answer.

The Atari Programmer's User Group

Hello again. Peter Hibbs has just released ICTARI 42, his last issue. The next one will be put out by.... ....me ! I soon expect to recieve the list of members and other materials, and will try to send the next disk-based version of the magazine to the subscribers by the 15th of next month. The new issue is now available at my WEB-site, which has also been updated. Go to:

http://www.elis.demon.co.uk/ictari/ictari.htm

What have I done ?

"Augeas"

I've never used Dlock(), but I did once have problems with Fsfirst() and
Fsnext(). It turned out that a call to the file selector in early TOS
versions was changing the DTA on me. I fixed the problem by inserting an
Fsetdta() immediately before the Fsfirst(). (And in the words of the Atari
Compendium, "Be careful to avoid assigning your DTA to a local or automatic

variable without setting it to its original value before the variable goes out of scope.")

I don't know if this will work, but the problem you describe sounds very similar to mine - my application kept trying to open null file names.

Stephen

Well, if you are looking for books, the Atari Compendium has info on
all the AES 4/4.1 calls. Alternatively, Modern Atari System Software
contains info on AES 4.0 calls.

If you want WWW pages, well I have some information on ToolBars on
my WWW pages, but I haven't done docs for all functions...

>And are there any free libraries for Pure C (I

No idea - I dont use Pure C, but the Lattice libraries have 4.1 support.

Hi!

In article <1e7cd$12e2d.190@hermes>,
     gmiller@inca.co.nz (Gaven Miller) writes:
> Whilst my app runs OK without fouling itself or the disc it is checking,
> when I use Dlock() prior to enumerating the directory structure with
> Fsfirst and Fsnext, the search reports "zero files" searched on the disc,
> even though there are ~2000 files on the drive. Removing the Dlock call
> gets the correct results.
Sure. Haven't you read the Dlock()-manpage? The first paragraph should clear
things up:

```
-- snip --
       Dlock  is used to lock or unlock the BIOS device indicated
       by drv.  No GEMDOS file  operations  are  permitted  on  a
                ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
       locked  drive.  Thus,  the Dlock call provides a mechanism
       for disk formatters or re-organizers  to  lock  out  other
       processes  while low-level BIOS or XBIOS operations are in
       progress on the device.
-- snap --
```

Dlock()'s main purpose is - as described above - to allow low level tools to
directly change the structure of a filesystem. If it would still allow
GEMDOS access to the locked drive (even by the caller), this could easily
cause a big mess, e.g. if a new file would be written during a defragmentation
process. Dlock() also makes sure that no process has open files on the drive

you wish to lock, because this could also leed to serious problems.

Another purpose of Dlock() is forcing a media change, which automatically happens when the drive is unlocked, because the contents could then be completely different.

So, don't use Dlock() if you don't plan to manipulate the physical data structure or need a media change to be forced for some reason. If you want to make your app more MiNT friendly, as you've written, better let it run in the MiNT-domain and use Dpathconf(), Dopendir(), Dreaddir() and Dclosedir() to count the files instead of the obsolete Fsfirst()/Fsnext()-combination.

And btw, don't check the MiNT-cookie if you want to use new GEMDOS calls like Fxattr() and Dlock(). Simply call them; if they do _not_ return -32L (EINVFN), you can use them. Otherwise, they're not available. This is important if you want your program to be able to use the enhanced GEMDOS calls with MagiC as well. Even some MetaDOS drivers offer Dopendir() & Co. without the need for MiNT!

Hope that helps ...

Ciao

Thomas

>
> Therefore it'd be logical (given the "load everything" philosophy GEMDOS
> seems to adhere to) to also load symbol and debug info at start time,
> prior to fixup and passing control to the app.

As far as I know, the OS really loads the complete binary into the RAM, but that's not a problem at all. The position and sizes of TEXT, DATA and BSS are set according to the program header, and when the BSS size is greater than zero, the BSS gets zeroed, thus overwriting (parts of) the symbol table in RAM (or the debug info), if the loaded program had one.

Ciao

The screenmanager of MagiC supports some undocumented messages you can send to it via appl_write(), and two of them are used to hide and unhide applications. Another one activates the menu bar of a running application. I could look up details, if you want.

Hi everybody!

I have an idea to any programmer out there.
I desperately need an utility to convert *color* WMF files from PC's (aargh) to GEM/3 and/or CVG 1.1 (both in color, of course).
Once converted, the file should be intact (i.e, no difference at all with the original WMF).

This program could be shareware. I'd register it as soon as it was developed. Anyone interested?

Of course, if such an application already exits, please tell me, also if this option is included into any other program not only dedicated to this task.

Thanx

```

Name: mimelite
     Product: library
     Platform: ANSI C
     Where:
ftp://oslonett.no/Software/MsDos/Kommunikasjon/Offline/mimelt20.zip
     Author: Gisle Hannemyr <gisle@oslonett.no>
     Comments:

         [Gisle Hannemyr <gisle@oslonett.no> 20-May-1994]

         "mimelite" is a simple, lightweight library written in ANSI C that
         supports the parsing of MIME headers and encoding/decoding of body
         parts, suitable for inclusion in offline-readers.

If you develop mail and newsreader software (user agents), you can link mimelite with your own program to make it support a significant subset of MIME (namely the Content-Transfer-Encodings 7BIT, 8BIT, BASE64 and QUOTED-PRINTABLE). mimelite also supports conversion between the ISO Latin 1 character set used for European character sets on USENET/Internet and PC-based character sets (e.g. Macintosh, IBM CP-437 and CP-850).

The distribution archive also contains UNMIME, a standalone program to decode MIMEd messages encoded with BASE64 or QUOTED-PRINTABLE encoding.

The mimelite library is general enough to work in a number of contexts, but it has been designed to work well on MS-DOS (where memory is a scarce resource). Its main application is intended to help extend MS-DOS-based "offline-readers" for RFC-822 and RFC-1036 conformant messages to also support RFC-1521 and RFC-1522.

Olly Betts (Archimedes)
Comments:

[John Gardiner Myers <jgm+@cmu.edu> 16-Feb-1995]

Mpack is a minimal implementation of MIME, designed for encoding and
decoding binary files in MIME messages. In short, it is the MIME
equivalent of uuencode and uudecode. For backwards compatibility,
it can also decode messages in split-uuencoded format. The Macintosh
port can also handle AppleSingle, AppleDouble, and BinHex.

Starting with version 1.5, all official mpack distributions are
PGP signed by "John Gardiner Myers <jgm+@cmu.edu>". The PGP
signatures are detached from the distributions themselves, in
files with the ".asc" filename extension.

[Arjan van der Meer <arjanvdm@htsa.hva.nl> 30-Jan-1995]

There is now a version of mpack/munpack for the Atari ST and
compatibles. It is just a compiled version of the UNIX 1.2 version,
but what I've tried worked okay. It is made by alex@hal.rhein-main.de.

IMPORTANT NEWS

Due to someone (you know who you are) whining to JTS about the
Howard boards sales, there followed a tense conversation between
John Scruch of JTS and Lance Rinquist of Video 61. The result
is that I have to publicly add these extra conditions/disclaimers
to our sale of Lynx development systems:

1. JTS does NOT support these systems in regards to hardware
2. JTS does NOT support the software for these systems
3. JTS will NOT provide technical support for Lynx game development
4. JTS has specified that we can sell these systems only under these
   terms: "AS-IS" and as "Collector's Items"

Simple translation: Don't bother John Scruch anymore. They sold
these units to us and they don't want to hear anything else about them.

So if you want to buy a very special Lynx collector's item, call
(612) 462-2500. The price is still $2000 each. Each one has a

serial number on the bottom and from the ones we have, there were
probably 200 of these units built at most.

I personally would think all those conditions were 'givens'. I doubt
that
JTS is willing to support ANYTHING developed or sold by Atari unless
they were required to by law.

Hello, I'm interested in a Talented programmer who knows their stuff
when it comes down to making Lynx games. I am perticularly into making a
racing game(or 5) for the Lynx. I have graphics already doen, and await
a programmer...

That depends on what you mean by `support'. The multitos AES
iconification scheme is worthless, so I wouldn't call it support.

No, GEMDOS only loads the Text, Data, and Relocation segments of a file.
The Symbol segment is never read. You can verify this by watching the
Rwabs() calls that happen during Pexec().

These really aren't appropriate questions for cross-posting to most of
the
comp.sys groups that they were sent to (the obvious exception being the
PC
one).

However, I can answer some of the questions you ask:

1. You should really try hard not to use DLLs unless you:

   a) are running several separate programs that share common
      functionality provided by the DLLs

   b) are using a DLL to "inject" into another program's memory
      space under Win95

   or c) have large portions of code in your application which are
      hardly ever used (they should preferably be reusable as well).

   This way, your program doesn't slow down unnecessarily by using DLL
   calls all the time, and doesn't force the system to keep loading and
   unloading unnecessary DLLs. Some programmers have a tendency to go
   way over the top in this area.

2. This is another possible reason for using a DLL. VB will not link
with
   C code, so you must place C subroutines in a DLL to allow the VB
program
   to call it. And yes, this is the way to use C compilers as a back end
   to a VB program. It would be better to re-write if you have time.

3. You'll have to be more specific here.

4. I suspect that it does; I'm not really all that sure - certainly, when
   using the IDE, it unloads DLLs when it stops running the program. This
   would tend to indicate that they are dynamically loaded, in which case
   it's up to Windows whether they remain around or get unloaded.

appl_tinfo or some such function. [I cannot remember exactly how right now...]

However, why do you need to check to see if it supports iconify? All AES versions will just ignore the SMALLER gadget if it doesn't support it. (ie. wind_create(SMALLER | TITLE...) will just not create the gadget, and you will never get a WM_ICONIFY message on older AES versions).

Anthony

Only of interest to UK users...

People doing bulk snailmail posting in the UK can get discounts from Royal Mail by presorting the mail to their spec and producing some reports. This service is called Mailsort; for more information, get in touch with your local Royal Mail sorting office.

Doing the sort and generating the reports yourself is much aggravation, and is best left to a computer. Enter Mailshooter, an application which reprocesses and sorts comma-separated-ascii mailmerge data and does all the other stuff too. It even calculates your costs and discounts.

The package has passed Royal Mail tests for correct production of results.

Requires 1MB+ memory, plus hard drive; on my STe it handles about 1000 records per minute. It can handle a data file bigger than available system memory, but will go slower.

Look for "mshoot11.zip" on 42BBS [+44 (0)1256 895106] .

It's shareware; fifty quid; the distribution is fully functional but unless you register you don't get the tool which takes the pain from installing Royal Mail's Mailsort database.

>JPEG Decoder?

Well, the actual documentation for that decoder is not freely available.
I got some 'reverse engineered' code from a guy here on Usenet (can't
remember his name) some time ago, though, which I have improved a bit and
am using in the latest MGIF beta versions. This code certainly does not
know about everything that JPEGD can do and it might not be as stable as
it could be. Still, it has loaded all JPEGs I've tested it with just fine
in both 24 bit and greyscale mode.

If you're interested, I'll see if I can find the code somewhere (I'm already
looking since someone asked for the same thing on one of the German groups
only a few days ago). My Falcon is dead so I can't access the MGIF sources
directly, but I'm sure I have floppy somewhere...

> press of the reset button (or keyboard reset) will cure it.

The first thing that comes to mind is that the system has entered an infinite loop.

```
> [...]
> ; ST RAM bus error handler  -
> ; A4 has failing address on entry
> ; sets d6 to error address
> ..fix_phystop            ; ST RAM bus error handler
>  movem.l    a1/a2/a3/a5,-(sp)
>  lea    16+8(sp),a1    ; a1 = "special status register" in stack
> frame lea    .l1ret(pc),a2    ; address to return to
>  lea    16+2(sp),a3    ; address in stack to fix before returning
          ^^^^
```

Where did you get this value from? I can't remember off-hand what order the CPU puts the SR and PC onto the stack but at anyrate this number should be negative. Remember:

```
        ds.b    1024
stack:  ds.b    1
```

The stack goes down memory not up it.

```
>  rte            ; return from exception
```

Because you have put the new address into the wrong place, rte will return to the point where the exception took place...

```
> ..tol1    tst.l    (a4)        ; test ram address - BUS ERROR
> possible! add.l    d4,a4        ; increment pointer
>  bra.s    .tol1        ; loop
```

Causing this to loop and generate another bus error, rte then sends you back to this position which then generates another bus error, and so on. Voila your infinite loop.

Jr,

Thanks for your response.

The code sets the RTE return address to be the first instruction _after_ the
loop - to the label ".l1ret" (loop 1 return)

> > [...]

```
>  > ; ST RAM bus error handler  -

```

16 = 16 bytes of registers saved on stack.
2 = return address is two bytes beyond registers in exception frame.

memory looks like this at entry to the bus error handler:

(on a 68010 or better CPU)

```
sp + 0   (saved a1)
sp + 4   (saved a2)
sp + 8   (saved a3)
sp + 12  (saved a5)
sp + 16  saved SR
sp + 18 return address
sp + 22 stack frame format (available on all exceptions from 68010+)
sp + 24 (exception data as generated by CPU)
```

(on my system [68030 CPU] the format word contains the value $B008, signifying exception vector offset was $008 (ie vector 2 - bus error), and stack frame type B (bus error, long format)

The 16+2 points at the return address to be "corrected" before the RTE.

On a 68000, the return address is another 8 bytes further on in the stack frame (at offset sp+26).

I set it up for a 68010+, and then a few lines later check the CPU. If it is an 010 or above, I skip the next line (which increments a3 to point to the stacked return address for a 68000).

The stack and everything else (CPU determination, for one), was set up around 500 lines before the code snippet in the usenet article.

If I was to do as you suggest, and use a negative offset from the stack, it would (1) be overwritten by the single step Trace-Trap handler the debugger uses, (2) be writing into unknown space, not related to the bus error exception frame.

```
>         ds.b    1024
```

> stack: ds.b   1

> Causing this to loop and generate another bus error, rte then sends you back
> to this position which then generates another bus error, and so on. Voila
> your infinite loop.

The address to return to is ".l1ret", which was saved into a2 before the
memory test code started, and before the first bus error.

This was put into the stack frame at the correct offset (according to my
docs) by my bus error handler.

We have the following Pentium Computer for sale.

Manufactuer: Canon

Specification:

Pentium 133 CPU
1.6 Gig Hard Drive

1.44 Floppy Drive
8X CD-Rom
28.8 Bps Modem
16MB of EDO Ram 72 Pin
Mid Tower with open 3 open 5.25 bays and 1 3.5 open bay
Case also has RF Connector
Intel Chipset Motherboard
16 bit Sound Card
1 MB PCI VGA Exp. to 2 MB
256k Pipeline Cache
PS/2 Keyboad and PS/2 Mouse
Windows 95

All computers are brand new from Manufactuer.

Price: $ 1,099 USD

Optional:

2 X 4 CD Recorder (Internal)
w/SCSI Card, EZ CD Pro Software
Price: 399.95 USD

Expand to 2MB of VGA Graphics
Price: $ 49 USD

Monitors Avilable Upon Request

If you have any questions feel free to call,
Please leave a message and your call will be returned promptly.

```

There's another likely cause... it's called a double bus fault, and is triggered when a bus error occurs inside your bus error handler; on almost all CPUs, causes the CPU to go into a halt state. This means that it's not even trying to run instructions any more, and will not do so until reset.

Are you absolutely certain that you're not either returning to the wrong address, or corrupting a register that you're using in the bus error handler as a pointer?

All you have to do is trigger another bus error, and you'll kill your system stone cold.

-----BEGIN PGP SIGNED MESSAGE-----

I'm reposting this here on behalf of Colin Fisher-McAllum, SysOp
of 42 BBS, as he hasn't quite mastered his usenet stuff yet.

Point of note: before anyone asks - yes, Daron does know that
this is being posted. In fact, he specifically requested that
Colin post something to let everyone know what was going on, and
why the NeST BBS network would be down.

Please don't email either Colin or I about this: everything
either of us knows is contained within this message.

I also urge all of you to think before posting any replies.
Remember that judicial laws state that someone is innocent until
proven guilty - Daron is a well-respected member of the Atari
community, and idle speculation would only harm his reputation.

Original from Colin Fisher-McAllum follows:

==========
====
I am sorry to say that until other arrangements can be made,
NeST is
closed.

Daron Brewood was raided this morning and all his equipment
impounded
subject to an investigation into computer pornography.

Regards

Colin

If you want to do SCSI programming, try downloading the CBHD harddisk
driver. It provides an SCSI programming interface.
It should be on ftp://ftp.cnam.fr/pub/Atari/Disk/

>iconify a window"?

Eg. when the user selects under the 'windows' menu 'iconify' the
application is able to iconify its own windows.

>>Also, many applications don't support iconify all, so if someone
>>control + clicks on the smaller a slot gets reserved, but no

>that don't support the iconifcation, right? I've never seen it on, say,
>my Prospero C editor. But I do agree that it would be nice if you could
>iconify applications that don't explicity handle iconification.

Annius means ICONIFY ALL which is sent when you click on the smaller
icon holding control. This should cause the application to appear to
iconify all its windows down into one icon. Try it. Desktop likes it,
and some programs like it, but others (eg Thing?) will ignore the
WM_ALLICONIFY message which will cause AES 4.1 problems (but not N.AES)

For starters, it wipes out all of the cookies already in the jar.
If it crashes the system, that at least would teach you not to run
it on a system which doesn't need it.

I am trying to write a 3D object plug-in for my Toolbox TSR.

This plug-in is to be responsible for redrawing and handling 3D objects on screen.

In order to redraw objects, a separate VDI virtual workstation handle is required. To open a virtual workstation, one needs the system workstation handle, which can be retrieved via the AES call graf_handle.

But the AES isn't available until all the AUTO folder programs have been enumerated and have run to completion (either Pterm, Pterm0 or Ptermres).

So, how do I open a VDI workstation from within the AUTO folder? And, if so, can I leave it open through a Ptermres() call? (So I can use the stored handle in my VDI redraw routines in the plug-in as called from the main app)

I believe thet I can use v_opnwk and open a full workstation, but that will then prevent GEM from using v_opnwk when it [GEM] starts.

At present, the plug-in requires the calling app to call an intialisation function, passing in a pointer to a buffer containing AES version (if it is over 3.3 and we are in a 16+ colour screen mode then 3D effects are applied, otherwise not) and the system VDI handle. On return from the init function, the rest of the buffer is filled in with pointers to callback functions in the plug-in to be used for redrawing (ie within a G_PROGDEF object)

And, of course, when the prog exits, it has to call a de-initialisation function within the plug-in.

But, this feels like a bit too much work. Is there a way to check AES version and open a workstation when the plug-in is being loaded at boot time?

The X servers for Mint are mono-only. If you want colour X on your Atari, you'll have to go with Linux or NetBSD.

What do you mean by "oldfashioned Freemint"? The FreeMint releases are

more recent than Mint 1.12, and from my experience, are remarkably
stable. X should be able to run on top of them with no problems (I
usually run AES 4.1).

Hi,

Just wondering if anyone knows of a good easy to use C Graphics library for
GNU C ???

Something like plot(int x, int y);
         polygon (int [], int)
would be nice !

Davy

I think you could try http://www.brainstorm.eu.org,
and then mailing raphael@brainstorm.eu.org for the details
on the jpeg decoder, after all he's the guy who did it.

I cannot guarantee an answer though; i understand they've
left the atari development aside for some time.

bye.

fab.

GEM Messages are enough to drive one completely mad...

Anyway, I have a little problem which I hope someone can shed some light
on...

In a program I am writing I'm using a loop to check the mouse status, among
other things. It looks something like this:

```
do {
     <stuff>

     event = evnt_multi( MU_MESAG || MU_M1, ... , 0, <workarea>, ...,
                  msgbuf, .... , mousex, mousey, mouseb, ..);

     if (event && MU_MESAG) {

          switch (msgbuf[0]) {
          case WM_REDRAW:
```

```
            <do stuff>
            break;
        }
    }

} while (!mouseb);
```

The MU_M1 part serves two purposes: it keeps the loop running and it checks whether the mouse is still in the work area. It seems to work fine.
The MU_MESAG bit however, is acting a bit strange.
When it gets a redraw message in this loop it keeps repeating the message until some other message appears... When the loop starts I get message nr. 8 (what is it?), which is repeated until I get a WM_REDRAW, which is then repeated until I get some other message..
What's going on? I've tried about anything to figure it out, rangeing from clearing vars to comenting out pieces of code.

Anyone?

Thanks...

The following bit of code is more what you seek as all the event
handling is done in one while statement:-

```
int main()
{
/* initialise program */

  m1flag = 0;           /*-- wait for mouse to enter rectangle ---*/
  timlo  = 0;           /*--- timer values ---*/
  timhi  = 255;
```

```
  done=0;               /*--- done flag set to 1 by QUIT or ^Q---*/

  while(!done)
    {
      /*--- the main loop of the application ---*/

      happened = evnt_multi(MU_KEYBD|MU_MESAG|MU_M1|MU_TIMER|MU_BUTTON,
                            1,             /* number of clicks to wait
for */
                            1,             /* mouse buttons bmask */
                            1,             /* bstate */
                            m1flag,        /* mouse pointer */
                            tidex,
                            tidey,
                            tidew,
                            tideh,
                            0,             /* m2flag */
                            0, 0, 0, 0,
                            msg,           /* message buffer */
                            timlo, timhi,
                            &mousex, &mousey,
                            &button,
                            &shiftkey,
                            &keycode,
                            &clicked);

      /*--- which event?  ---*/
      if(happened & MU_KEYBD)
        {
          do_keyboard(shiftkey,keycode);
        }

      if(happened & MU_BUTTON)
        {
          do_button(mousex, mousey, button);
        }

      if(happened & MU_M1)
        {
          do_tidemouse(mousex,mousey);
        }

      if(happened & MU_M2)
        {
          /* do nothing in this case */
        }

      if(happened & MU_MESAG)
        {
          do_message(msg);
        }

      if(happened & MU_TIMER)
```

```
        {
          /* do nothing in this case */
        }

    } /* end of while(!done) */

/* clean up here */

return EXIT_SUCCESS;
}
```

Hi all.

I hope someone can help me out with a weird problem concerning AES messages.

The scenario is that keyboard shortcuts are picked up by evnt_multi() and passed to a function for checking. If they are valid, a message is sent via appl_write() to the AES to say that that menu item has been selected and from then on the program behaves as if it really had.

Or it did in the last version of the program. In the new version I am currently working on all keyboard shortcuts have stopped working. What's really strange about this is that, since they worked perfectly before, I haven't touched this part of the code.

Tracing the thing through, I can tell you that the key scan codes are picked up correctly and passed on. The correct menu item is selected and the message is assembled correctly and appears to be sent OK. However, after passing through evnt_multi() it has changed radically. For example, pipe[0], which was MN_SELECTED (13) has changed to 0. Anybody got any idea what is going on here and how I can counteract it?

Regards
Martyn

In addition to the other typo noted previously, there is one here, too. That line should be MU_MESAG | MU_M1. As it's written above, you will effectively only ever end up with MU_MESAG events.

lvzon@bio.vu.nl (Levien van Zon) said:-

>GEM Messages are enough to drive one completely mad...

You might want to investigate putting evnt_multi() into a structure
and use Evnt_Multi() instead. Apart from keeping everything nicely
together and thus more readable, it also allows you take advatage of
using defaults which means no silly crashes ...

```
#ifndef  EVM_H
#define  EVM_H    EVM_H
typedef struct    {
int16    evm_event;    /* required events */
int16    evm_clicks;   /* required number of clicks (usually 1) */
int16    evm_button;   /* required button (1==left,2==right) */
int16    evm_bstate;   /* required state (0==up,1==down) */
int16    evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1;       /* default, all set to 1 */
int16    evm_m2io; /* default outof */
Rect evm_m2;       /* default, all set to 1 */
int16    *evm_msg; /* message buffer */
uint32   evm_time; /* timer value */
int16    evm_mousex;   /* mouse xpos on exit */
int16    evm_mousey;   /* mouse ypos on exit */
uint16   evm_mbutton;  /* mouse buttons on exit */
uint16   evm_kstate;   /* ie shift ctrl keys etc */
uint16   evm_keycode;  /* scancode and ascii code  */
int16    evm_clicked;  /* mouse clicked this many times on exit */
}   EVM;
#endif   /* EVM_H */
```

Er, Rect is defined as:

```
typedef struct {
int16 x,y,w,h;
} Rect;
```

The Evnt_Multi() function could be defined as ...

```
#include "evm.h"
uint16
Evnt_Multi(m,init_flg,msgbuf)
EVM  *m;
```

```
BOOL init_flg;
int16    *msgbuf;
{
 if (init_flg)    {/* some reasonable defaults */
     m->evm_event = MU_MESAG;
     m->evm_clicks = 2;
     m->evm_button = 1;
     m->evm_bstate = 3;
     m->evm_m1io = 0;
     m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;
     m->evm_m2io = 1;
     m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;
     m->evm_msg = msgbuf;
     m->evm_time = 0;

     return 0;
 }

 if (!m->evm_msg)  {
     form_alert(1,"[3][ Evnt_Multi() | Not initialised ][ Fatal ]");
     return 0;
 }

 return evnt_multi(
         m->evm_event,
         m->evm_clicks, m->evm_button, m->evm_bstate,
         m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
         m->evm_msg,
         (uint16)(m->evm_time & 0xffff), (uint16)(m->evm_time >> 16),
         &m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
         &m->evm_kstate, &m->evm_keycode,
         &m->evm_clicked
         )
 ;
}

.. and in use you would do something like this ...

static EVM    evm;
main()
{uint16  events;
 int16   msg[8];
 BOOL    done =FALSE;

 appl_init();
 Evnt_Multi(&evm,TRUE,msg);
 evm.evm_event |= (MU_M1 | MU_BUTTON | MU_TIMER);
 evm.evm_time = 1000;

 while (!done)    {
     events = Evnt_Multi(&evm,FALSE);
     if (events & MU_MESAG)  Hndl_MESAG();
     if (events & MU_M1)    Hndl_M1();
```

```
     if (events & MU_BUTTON) done = true;
     if (events & MU_TIMER)  Hndl_TIMER();
     /* ... */
 }

 /* ... */
}
```

Believe me, it's well worth implementing something like this!

Maybe the message pipe has overflowed?

It might be better to post the code as it could be something as simple
as a memory leak.

I know of a program called "The Cookie Monster" which has a large list of

cookies. I do not know how complete the list is, although it does contain
373 cookies in the (probably out of date) version that I have.

The author of The Cookie Monster can be contacted at:

J.J.Troup@comp.brad.ac.uk

according the documentation.

Anybody know if I can use a mono VGA monitor as I can't get hold of an
Atari one. Obviously will have to change connector but is the scan rate
right?
Thanks for any advice. Chris.

... Now you're ready for the actual shopping. Your goal should be to get it over with as quickly as possible, because the longer you stay in the mall, the longer your children will have to listen to holiday songs on the mall public-address system, and many of these songs can damage children emotionally. For example: "Frosty the Snowman" is about a snowman who befriends some children, plays with them until they learn to love him, then melts. And "Rudolph the Red-Nosed Reindeer" is about a young reindeer who, because of a physical deformity, is treated as an outcast by the other reindeer. Then along comes good, old Santa. Does he ignore the deformity? Does he look past Rudolph's nose and respect Rudolph for the sensitive reindeer he is underneath? No. Santa asks Rudolph to guide his sleigh, as if Rudolph were nothing more than some kind of headlight with legs and a tail. So unless you want your children exposed to this kind of insensitivity, you should shop quickly.

Hi all,
I am a keen programmer and I am having a problem with detecting keypresses. This is what I would like to be able to do:

- Call a function that will return the scan code of any key that is

pressed down at the time.

> I know that the Atari ST has double debouncing so it would only be able to return the scan code for the last key that was pressed, but that will be fine.
> I can call a function to return a value for the shift, control, etc.. keys without any problems using one of the XBIOS routines. I would like a similar function for the other keys.
> I have tried using other XBIOS routines relating to keyboard detection, but they all seem to use a keyboard buffer. This means that it returns the last key that was pressed, and not necessarily the key that is being pressed at the time.
> I need to be able to tell if a key is being pressed or not being pressed at the time the function is called.
> I managed to find a memory location (521 bytes after the keyboard buffer, I think) on my 2meg STE that does the trick: When a key is down the memory location hold the scancode for that key. When no key is down the memory location holds a null byte.
> I can call a function to check the value in this memory location, and therefore detect which key is being pressed, if at all.
> This memory location varies for different TOS versions and different machines!
> I believe there must be a command in BIOS, XBIOS or GEMDOS (or something else) that will allow me to detect a keypress without using a keyboard buffer or repeat/delay rates etc..
> ..or there may be some way of finding out where the memory location (holding the scancode) is for the machine that the program is running on.

I program using GFA basic, but I should be able to call BIOS commands that other languages use. If anyone could help me I would be very grateful. Thankyou.

Dan Jones.

It is included as part of the Geneva and NeoDesk 4 demos, available from
www.pair.com/gribnif . Yes, it is freeware, and developer docs for the
function calls are available upon request (they are included with Geneva
and NeoDesk 4).

g > I'd rather Malloc() a block of RAM

After you call Ptermres(), the OS regards your program, basepage and all, as just another Malloc() block. To call Malloc() you would first have to call Mshrink() to free up some RAM for it to allocate. This approach is both simpler and causes less memory fragmentation.

Admittedly, the more you mess around with the basepage, the greater the risk of modifying something the OS actually uses, but I seem to be able to get away with this one.

g > And, you have missed out the "unjar" code which should be
g > executed during system reset.

You only need to do that if you are going to check for an existing cookie jar at boot time. As you may have noticed, this program wipes out any pre-existing cookie jar (so don't use it if you don't know whether or not you already have a cookie jar).

I was just wondering about BUS errors. I own a DirecT60 Hades clone. Sometimes when I am using CAB, I will try to got to a certain website

and I will get a BUS error. I then hit return and I am at the
desktop. I was wondering if the fault lies with the T60 or is it that
if the website was formed using Netscape, then it might be that CAB
in incompatible with the html doc it is trying to load.

The ST hardware cannot play samples. However, it is possible (but very
tricky) to emulate STE hardware on the ST.

The STE/TT hardware can only play raw signed 8-bit sample data.
WAV, AVR and SND are file formats. That is, different "standards" of storing
samples on disk. To play a sample file you need to read the file to memory
and "decode" it into signed 8-bit samples.

The F030 hardware can play both 16-bit and 8-bit signed sample data.

It seems it does. It is nasty, and I do not recommend it for any case
where things can be done without it.

> The thing is, I haven't tried this, and I don't know whether

Interesting enough, occasionly you need it in multitasking systems
too. When designing the new STiK we came across a problem that seems to
require the method for a solution, even with multitasking.

Tell you : Those who want large arrays of floats. I once had to use a array
of

float psi[400][200][100];

Do I need to tell you the difference if I exchanged the `float' by
`double' ?

Even more unlikely..

I's probably just a bug in CAB or in the TCP/IP drivers (STiK I presume?)
or the overlay. Try Downloading the newest version of CAB and STiK, maybe
the errors wil go away...

I (lvzon@bio.vu.nl) wrote:

: * Source distr of a GAS which can output mc68000 TOS binaries

: * Source distr of Binutils that can handle object files compiled by
:   GCC 2.6.3 for Atari (OR patches for the GNU Binutils to implement
:   a m68000-atari or m68000-mint target)

These binutils are giving me a headache!
I was looking through the newest GNU binutil sources yesterday,
and it accured to me that there was support for lots of targets,
including AmigaDOS, MSDOS (which doesn't come to in a lightyear of even
remotely resembling a UNIX system) and lots of systems I've never heard
of, but _not_ for TOS/MiNT.
That shouldn't be too hard to implement? So I looked a bit further,
and it appears that the main effort in implementing a new target is
to write an out-file description for the so called BDF (binary description
format?) library, which is then used in compiling GAS and the binutils.
This implementation of a new out-file format should simply be a case of
taking an existing description and editing it, at least, thats what the docs
say...

There is just one tiny problem: I don't know _anything_ about the
atari executable/object file format. So I'm looking for volunteers
to send me detailed information on this format, or to have a go at directly
implementing it (preferred, I'm a lazy bastard :), so that we can
produce an atari/MiNT target for the GNU binutils... Anyone?

Thanks...

Mainly because a lot of TOS programmers were either lazy and took shortcuts in
their programming (ie. Not using standard TOS calls) or they were innovative

and found a way to make the machine so somethine it wasn't supposed to.. which makes the application not 100 compatible all the time. I can't speak for those apps in particular, but a lot of Atari apps are like that...

If I remember correctly, this is exactly what I did in Edith Pro
for the Atari. Change _p_run only when running as an accessory,
and not when under MultiTOS. I don't remember if it was harmful
to do so anyway.

If you want to see some cookie jar code, have a look at the source for
TAPEBIOS (should be on umich). this is a SCSI streamer program, but it
installs a cookie for itself.

It checks for the existance of a cookie jar & expands its size if found,
or creates one if needed.

No, it's not wrong. The 68000 _is_ 16 bit internally.

>adding 32 bit numbers would take far more time if this were not the case.

It _does_ take longer.
Check your instruction timing tables for any 16 bit vs 32 bit operation
(not move) between registers (so no memory access is taking place).

For example, a simple data register to register add takes 4 cycles for
byte or word while it takes 6 (or rather 8 on an Atari) for long.
This is because the ALU is only 16 bit wide.
On an '020 and up, the operations take the same time. Guess why?

>Turn it around, then it makes more sense : The MC68000 is a full 32 bit
>processor that has a 24 bit address and 16 bit data bus interface. The

While you are correct about the external busses, the fact remains that
the 68000 is a 16 bit implementation of a 32 bit architecture.
There's nothing strange about that.

>notion of the 68000 being 16 bit architecture was only stated by Intel
>fans at the time who could not stand that Motorola had the more advanced

When you only speak about 'architecture', you normally mean instruction set
architecture, of which the 68k series has indeed always had a 32 bit one.

>The SCN68000 is the first implementation of the S68000 16/32 bit
>microprocessor architecture. The SCN68000 has a 16 bit data bus and 24
>bit address bus, while the full architecture provides for 32 bit address
>and data buses. ...

But that quote says _nothing_ about the internal implementation.
You could do a bit serial 68000 if you wanted, which still would look
just the same from the outside.

It was said that the C compiler removes all the blanks before processing. While there are languages where that is true, C is not one of them.

The following are all legal C code, but with completely different results:

```
static char ge;
static charge;  /* implied int */

a = b++ + c;
a = b + ++c;

a = b && c;
a = b & &c;
```

Basically, blanks are used to separate operators from operators and names from names. Blanks between names and operators don't matter.

```
char *p;
char* p;
char * p;
char*p;
```

g > Depends on the compiler.

We were discussing Pure C.

g > But who wants to use floating point anyway? <G>

Well, I paid for the FPU, so I thought I might as well use it...

BTW, I suspect Lattice C defaults to int == long just to be
different (sort of like Spinal Tap's amplifier which went to 11).

In the ST world, yes pure assembly is the best way to go for games. But if you're a good programmer, then you can get the same results from STOS. You can even add assembly routines to make it even better and faster.

In the PC world however...the real reason why we have to upgrade to bigger computers is simply because commercial programmers are too lazy to write efficent code. This pratice has been "blessed" by MonkeySoft because, however sad it is, Billionaire Bill setted the standard for the software industry.

In an old article of Id software, they said that they used only C++ in Doom and it would be pointless to use assembly which wouldn't improve things majorly. Well, it's because they are real good at programming...but when someone else also uses only C++, they may have just slopped it all together for all we know. Dave Perry in the latest issue of Next Generation recommends using assembly even on RISC machines which gives a speed improvement. It's little things like this that sets your product over the competetion.

>if a game is fun does it realy matter what language it was written in.

All languages have their good points and bad points, so this big debate is
really pointless. There's nothing wrong with having STOS, C, and an
assembler at the same time. :)

> this comment is more directed at the people who dont beleive stos games are
>good at all, I have found several games written in stos/amos to be quite enjoya
>ble
>and people shouldnt judge a game but how it was programmed(if its fun)

Case in point...Wacko Software and Stosser both make games in STOS basic.
Same language. If you play any of Wacko's games, then you know know the
idea of "crap" is much more than just an abstract concept. Stosser on the
other hand makes brilliant games IMHO. He knows how to get the most from
STOS, the correct techniques of coding, and have the right tools mainly
Missing Link extension. If you didn't know he wrote them in STOS, you
might have thought they were in assembly.

The moral...don't say, "Ugh...STOS is bad, look at this game" but rather
"Yech, this game is crap...whoever wrote this is not good at all."
Programs say alot about the people who wrote them.

Like I said, languages each has their strengths and weaknesses. I
personally would use STOS for game writting, plus being able to include
assembly routines for speed and TOS calls is a mahor plus. C is good for
Gem applications, though you can write games but they would not be arcade
fast. Yet you can get away with games that just wait for your mouse click
and look good in a window. :)

If you're real good at assembly to write a game competely in it, go for
it! It would be much faster and better if you know how to squeeze it out
of the system. :)

> Got it ?

(I see a flamewar over descriptions beginning to brew).

BTW: If I may be allowed to ad my $4.95 plus-GST: The 68000 is a 16-bit processor - because the ALU is 16-bit, and therefore must make two passes to handle 32-bit data as allowed by the ISA. The first 32-bit 68k member was the '020.

There are three ways of determining the 'bit-ness' of a CPU : ALU width and data-bus width, and internal data-path width. The most common (and, to my mind, the most accurate) way is the ALU width, as this says how much data it can handle in one go. It may need more than one go at the data,

but it can only ever handle ALU-width data at a time.

The second method, data-bus width is irrelevant and inaccurate nowadays. All modern processors (040, 060, Pentium, Alpha, PPC) have data buses wider than the ALU. In the case of the 060 (and both Pentium and 60x PPC's for that matter) we have a 64-bit path to memory, but a 32-bit ALU, register set, and ISA. (In the past this was a good way to compare them, as ALU equalled bus width. [68000, 68010, 80286, 6502, 8088 all have data-bus widths equalling the ALU width], but with processors like the 386SX you have a 32-bit ALU and ISA, but a 16-bit data bus).

The third method, internal data-path width is something else entirely. Some processors can, even within the same "CPU-name" have differing path widths internally. [BTW: I am talking things like cache-to-ALU and register-to-register]. I have minimal knowledge here, so I'll not comment any further.

BTW: For the acronym-challenged:

ALU: Arithmetic & Logic Unit. In essence this just means the "brains" of the CPU are within the Logic part, and all maths ops or register manipulations [Loading, Storing, Adding, Setting/Clearing bits etc] are carried out by the Arithmetic part.

ISA: Instruction Set Architecture. What the programmer uses to command the CPU.

Or, better yet, use Num*8 bytes beyond the end of the BSS. (I assume you are not interested in symbol data or debug info which will immediately follow the BSS block [if any]. Overwriting either of these will not harm the functionality of the app).

Perhaps something like this

```
     move.l   4(a7),a0  ; get basepage pointer into a0
     lea  __stack,a7    ; stack at end of BSS?
     move.l   #$100,d0  ; size of Basepage
     add.l    tsize(a0),d0  ; add text size
     add.l    dsize(a0),d0  ; add data size
     add.l    bsize(a0),d0  ; add size of BSS
     lea  0(a0,d0.l),a6 ; "new" jar pointer
     add.l    #8*NUM,d0 ; add space for NUM cookies
     move.l   d0,savesize   ; save "keep size"
     move.l   d0,-(a7)  ; space to shrink to
     move.l   #mshrink<<16,-(a7) ; Mshrink & null param merged
     trap #1        ; GEMDOS call
     addq.w   #8,a7         ; clear stack

     move.l   a6, jarptr

     pea  newjar
     move.w   #supexec,-(a7)
     trap #14

     clr.w    (a7)
     move.l   savesize,-(a7)
     move.w   #ptermres,-(a7)
     trap #1

newjar
     ; install new jar, copy old (if any) contents into new jar
     ; goes here, then set p_cookies system var, and return to sender
     move.l   newjar,$5a0,w
     rts
```

> wipes out any pre-existing cookie jar (so don't use it if you don't
> know whether or not you already have a cookie jar).

I found that some older systems (especially those prior to the STE - my old Mega 4 with TOS 1.02 for example) seemed to keep the old value constant through a warm reset, meaning any software which loaded earlier in the boot phase than the one who created it last time will write into unowned space, and therefore the cookies they place there will (possibly) get overwritten with random guff.

So, as an early fix to my Toolbox TSR, I added unjar code and this problem disappeared. <shameless plug> It [the Toolbox] also fills it in with correct values of many common (documented) values, and corrects TOS errors in jar contents (For example: the "I know one is there, but I can't tell which one" FPU cookie bug in all TOS 3.x and 4.x that I am familiar with).

And, of course, the only things that should write to the cookie jar are TSRs loaded from the AUTO folder at boot time. Transient apps should not. Accessories are doubtful - especially as they can be killed easily under MTOS (an early accessory of mine used CTRL-clicking the name a "I want to re-configure you" instead of "I want you to do something", whereas MTOS redefined it to mean a death-knell to the app or DA.

Hi again,

We still have 4 systems left, each consisting of:

a Howard board
in case with the same footprint and color scheme as an Amiga 2000
the (Howdy) display unit
these are stereo enabled ... A Pinky/Mandy unit is NOT capable of stereo
full documentation
call it 3 pounds, 2 inches, or a few hundred pages... it's a lot
complete development software
9 Amiga floppies with Atari/Epyx programs, demos, sfx, utilities
1 Amiga formatted floppy with extra routines by Bastian Schick and myself
Expert technical support via email included.
Access to cartridge prototyping, production, packaging, & marketing included.

All this can be had for only $2000 + shipping each. You won't find a
better offer anywhere in the world! Atari charged developers $5000 for
these units but you get one for less than 1/2 the price.

We also have ONE Amiga 2000 with 5M RAM, 51Meg HD, WB 1.3 and the development
system preloaded on the hard drive. It's only $400 + shipping with the
purchase of a Howard board. This makes a complete (high-end) Lynx development
system for only $2400 + shipping (expect about $60.00 continental US)

Don't miss out! Just like Lynx games, these prices are NOT going to get
any lower.

}}}}}} Call Lance at Video 61 (612) 462-2500 to get yours now! {{{{{{

fine print:
1. You must supply your own monitor for the Amiga.
2. We accept most major credit cards, but the conditions are "no returns".
3. Personal checks will have to clear before shipping.
4. Units are returned from developers and sold "AS-IS". All of them have been tested for all major functions to insure working status before shipping.
5. The usual disclaimers about software doing what it is supposed to do, not what you expect it to do in all cases and it's not our fault if the UPS man drops it on your foot.
6. Any and all typos are mine...

Harry Dodgson
2600/7800/Lynx developer

Hi!

N.AES have some new AES-calls, one of them is quite useful. I've used it in a small program that adds "virtual desktops" to N.AES. If developers of other AES'es (MagiC, Geneva, XaAES, oAESis...) could add this call the program would work with this (And a couple of others.) too.

Excerpt from the N.AES-docs...

```
7.7  appl_control                                          N.AES

 Aufgabe:    Gezieltes Steuern von Anwendungen.

 C-Prototyp: int appl_control(int ap_cid, int ap_cwhat, void
             *ap_cout);
```

```
 Binding:    control[0] = 129
             control[1] = 2
             control[2] = 1
             control[3] = 1
             control[4] = 0

             int_in[0] = ap_cid
             int_in[1] = ap_cwhat
             addr_in[0] = ap_cout
             ap_creturn = int_out[0]
```

Parameterbeschreibung:

```
 ap_cid:     Die Applikationsidentifikation (apid) der Anwendung, die
             gesteuert werden soll.

 ap_cwhat:   Die Art der Steuerung:

              0 bis 9          reserviert f►r N.AES

              APC_HIDE (10)    Applikation ausblenden
                               Wird f►r ap_cid -1 ►bergeben, so wird
                               die aktuelle Anwendung ausgeblendet.

              APC_SHOW (11)    Applikation einblenden
                               Wird f►r ap_cid -1 ►bergeben, so
                               werden alle ausgeblendeten Anwendungen
                               eingeblendet.

              APC_TOP (12)     Applikation in den Vordergrund bringen
                               (zur aktuellen Anwendung machen).

              APC_HIDENOT (13) Ausblenden aller Anwendungen bis auf
                               die in ap_cid angegebene, welche zur
                               neuen aktuellen Anwendung wird.
                               Wird f►r ap_cid -1 ►bergeben, so
                               werden alle Anwendungen bis auf die
                               aktuelle ausgeblendet.

 ap_cout:    Wird abh►ngig von 'ap_cwhat' vom AES gef►llt (momentan
             noch unbenutzt, die ►bergabe eines Nullzeigers ist
             m►glich).

 ap_creturn: Returnwert:

              0:        ein Fehler ist aufgetreten

              Wert > 0: kein Fehler aufgetreten
```

Anmerkung:
Ausgeblendeten Anwendungen wird in der Men►leiste ein '*' vorangestellt, es sei denn, sie hatten im Moment der Ausblendung kein

Fenster offen. In diesem Fall wird nur die Anwendung gewechselt.

Der '*' vor dem Namen bedeutet also genauer: Einige oder alle
ge⍰ffneten Fenster dieser Anwendung sind ausgeblendet.

On or about 10 Jan 1997 08:50:35 -0500, Rochelle Rogoff
(rochelle@umcc.umcc.umich.edu) did proclaim:

While I _never_ normally do this, I feel I must, simply because of
the false claim =')

(We also have ONE Amiga 2000 with 5M RAM, 51Meg HD, WB 1.3 and the development
(system preloaded on the hard drive. It's only $400 + shipping with the
(purchase of a Howard board. This makes a complete (high-end) Lynx development
(system for only $2400 + shipping (expect about $60.00 continental US)
(----------

(Don't miss out! Just like Lynx games, these prices are NOT going to get
(any lower.

They sure will. That 2k w/5MB 51MBHD an WB1.3 can be had in
comp.sys.amiga.marketplace for nomore than $175.00 and even that's

pushing it. Heck, you might even get a monitor with it for an extra
$25 or so.

Perhaps you should have said "_our_ prices are NOT going to get any
lower"?!? =')

(4. Units are ... sold "AS-IS".

An "AS-IS" 2 grand investment? You'd have to be a fool to take one
up on something like that.

ooops,

thanks for clearing that up, I only meant that the tabs and indentation
were for readability purposes and were ignored by the compiler. It does
not remove every blank...some blanks are important, you are correct.

Well, GCC does the same thing.
Three other 68k C compilers I've used (none available for the Ataris (yet))
have 32 bit ints as well and two of them have no way of changing to 16 bit
ints (I don't know about the third).

I always use GCC with -mshort (for 16 bit ints) myself since most Atari
machines are slower at 32 bit operations. When I use Lattice C I leave it
at the default setting to let the optimizer work.
I wouldn't dream of using Lattice C (or PureC for that matter) for release
versions of MGIF, though.

Or for that matter, you could use the DTA/command line buffer. That way you only waste 128 bytes.

BTW, the symbol table and/or debug info is not loaded into RAM by the system.

I suspect that the OS doesn't ever look at the basepage once the program is loaded. It is simply used during the loading process and as a one-way information transfer.

Actually, you can play samples on the ST using the PSG chip. The problem is that you have to write a routine by yourself just to do that. Samples are played on the STe/TT using calls to hardware registers and the Falcon uses special XBIOS calls.

Just thought I can clarify this... :)

Yep. Trouble is the older compilers may not even have limits.h and in
fact MWC does not so I thought it best to just say atari char = 1
byte.

```
> >
> > sizeof(char)    = 1 byte.

>Not very usefull I think.
```

So very true! I used the wrong Nos when posting. 0.42 has a printf bug where printf(s) was used instead of printf("%s",s). Mike has fixed this now but I need killfiles so I'm waiting for those before I can use the fixed version.

```
>Let's do it this way...
>
>#include <stdio.h>
>
>int main(void) /* main has to be of the type int according to ANSI */
>{
>  printf("%i\n", (int)sizeof(signed int));

>  return 0; /* exit succes */
>}
>
>The operator sizeof() has an result of the type size_t, the type of size_t is
>compiler dependent. That's why I cast the answer to an int.
```

I'm not very up to date with the ansi standard but I must mention that this needs to be investigated with pre-ansi compilers. It may or may not exist, or if existing, may not be fully ansi compliant. MWC for instance, defines size_t as a long (32 bit); there is no %i formatter and sizeof() returns an int (16 bit)!

>What tokens do strtok() return (add a puts(p) in the loop)?
>I mean, does it get past your '\0' after having considered ' line1 '
>and ' line2]' tokens?

Yes.

>(Wouldn't you want to include ' ' as well and break up at ']'?)

The ']' yes but not the spaces. The routine in question is concerned
with dynamically allocating an OBJECT tree for a windowed alert driven
by a printf() type front end.

>If the second token is indeed what I wrote, it appears the strtok() needs
>more than one '\0' to stop and you're just lucky to have an extra one after
>the string. That would of course make the strtok() quite buggy!

That appears to be the case. I've just had the time to experiment with
the following ...

```
#include <string.h>

main()
{char    *s[2],
     *p;

 s[0] = " line1 | line2 ][ Ok | Cancel ]@";
 s[1] = strchr(s[0],']');
 *s[1]++ = NUL;
 printf("s0={%s}, s1={%s}\n",s[0],s[1]);

 *strchr(s[1],'@') = NUL;

 p = strtok(s[0],"|");
 while (p)    {
     puts(p);
     p = strtok(NULL,"|");
 }

 p = strtok(s[1],"|");
 while (p)    {
     puts(p);
     p = strtok(NULL,"|");
 }
}
```

.. which produces the expected results. If I take out the hack for
the trailing '@' then it produces this ...

```
s0={ line1 | line2 }, s1={[ Ok | Cancel ]}
 line1
```

```
 line2
[ Ok
 Cancel ]
s0={%s}, s1={%s}

[ Ok
 Cancel ]
s0={%s}, s1={%s}
```

.. and it just so happens that MWC is storing the printf() format string directly after the alert string.

My original code needed to leave the alert string intact thus I was using strdup() - naturally there was less chance of there being two nuls in dynamic space than in the static space used in the above test program.

So, MWC strtok() _is_ knackered!!!

Oh. My error.

I just thought that all of the executable file was loaded at app start.

After all, all the code and data segments of the app are loaded during app start, and the bss space appears at the end of the data space in RAM.

Therefore it'd be logical (given the "load everything" philosophy GEMDOS seems to adhere to) to also load symbol and debug info at start time, prior to fixup and passing control to the app.

> I suspect that the OS doesn't ever look at the basepage once the
> program is loaded. It is simply used during the loading process and
> as a one-way information transfer.

However, if I was writing a multi-tasking OS, I'd use the "reserved" portions of the basepage for internal info used during task switch (the apps priority, last time it was given CPU time), and during shutdown (such as pointers to an internal [to the OS] table with a list of Malloc blocks used by the app, and so forth). Therefore, I would (as an app writer) leave the basepage alone - otherwise the OS may vomit over the rest of the system when it hits unknown data placed there by the app.

However, the command-line portion of the basepage seems to be fair game. It gives room for sixteen (128/8) cookies. And with the DTA overlaying the command-line area, I'm a bit more paranoid about setting it to somewhere else before using any of the directory enumeration funcs (Fsfirst and Fsnext spring to mind)

>While I _never_ normally do this, I feel I must, simply because of
>the false claim =')

What is the false claim? Is there anyone in comp.sys.amiga.marketplace selling Lynx development systems? Haven't you ever heard of value-added retailers in Canada?

>(We also have ONE Amiga 2000 with 5M RAM, 51Meg HD, WB 1.3 and the development
>(system preloaded on the hard drive. It's only $400 + shipping with the
>(purchase of a Howard board. This makes a complete (high-end) Lynx development
>(system for only $2400 + shipping (expect about $60.00 continental US)
>(----------

>(Don't miss out! Just like Lynx games, these prices are NOT going to get
>(any lower.

>They sure will. That 2k w/5MB 51MBHD an WB1.3 can be had in
>comp.sys.amiga.marketplace for nomore than $175.00 and even that's
>pushing it. Heck, you might even get a monitor with it for an extra
>$25 or so.

Sure, go buy an Amiga from someone else - we will still help you install the software on it. Since we only have one Amiga and four Howard boards, people will have to get the other Amigas from somebody else. It does sound like a good place to buy monitors too. But if you bothered

to read in the correct context, we aren't selling the Amiga as a stand-alone system. Only as part of a package. For the person who wants a pre-installed system (which looking at PC sales, there are lots of them), it makes sense to offer one. And PC retailers do charge extra to install software and make sure everything works together. We also checked with a local Amiga dealer and he was selling Amiga 2000's for $400 each.

>(4. Units are ... sold "AS-IS".

>An "AS-IS" 2 grand investment? You'd have to be a fool to take one
>up on something like that.

And the people in comp.sys.amiga.marketplace are offering warranties on their products? Ever buy a car from a used car dealer? The last one I bought was for $7000 and had AS-IS marked on the sticker. What that means in the US is that it has no express warranty. The buyer accepts the fact that it might have some scratches and been used before. These units have been tested and do work. What does AS-IS mean in Canada?

>   ///\ Thomas Clancy

the opinions expressed here are my own
the facts (claims) expressed here are true, not false

(I wonder why people in England and Canada have a hard time with people getting paid for an honest days work? Could it be their knowledge of American English and culture is lacking? Or are their morals really that different?)

Hi!

Does anybody know how Appline takes control over the windows in MagiC?
I've browsed the MagiC-docs and haven't found anything helpful there.

(rochelle@umcc.umcc.umich.edu) did proclaim:

(What is the false claim? Is there anyone in comp.sys.amiga.marketplace

They make it sound as if they are doing you a favour by over-charging
for an ancient machine. They said (basically) that you wouldn't find
it anywhere is for less (false). They might be offering a deal on the
lynx-only stuff... but they're taking you to thte cleaners on the
A2000 setup.

(selling Lynx development systems? Haven't you ever heard of value-added
(retailers in Canada?

Value-added? Bah! I call it taking advantage of those that don't know
any better. He he not claimed that a lower price could not be found,
I would not have posted the info.

(>They sure will. That 2k w/5MB 51MBHD an WB1.3 can be had in
(>comp.sys.amiga.marketplace for nomore than $175.00 and even that's
(>pushing it. Heck, you might even get a monitor with it for an extra
(>$25 or so.

(It does sound like a good place to buy monitors too. But if you bothered
(to read in the correct context, we aren't selling the Amiga as a stand-alone

Context? Go reread what you posted.

(system. Only as part of a package. For the person who wants a pre-installed

Yes, and you made it sound that since (and only if you're buying this
package) we'll throw in this dandy system for this real-good price.

(make sure everything works together. We also checked with a local Amiga
(dealer and he was selling Amiga 2000's for $400 each.

Because you neighbour robs banks doesn't justify the fact that you do
to. If you can't compete with the market, then pehaps you shouldn't
be in it.

(>(4. Units are ... sold "AS-IS".

(>An "AS-IS" 2 grand investment? You'd have to be a fool to take one
(>up on something like that.

(And the people in comp.sys.amiga.marketplace are offering warranties on
(their products?

Almost 100% of the people there offer DOA guarantees, alot offer 30 days
etc.. You'll never see gear valued at over $75 sold as-is (rarely).

(Ever buy a car from a used car dealer? The last one I
(bought was for $7000 and had AS-IS marked on the sticker.

Then you're crazy.

(What does AS-IS mean in Canada?

In my province, it means nothing. It means that if there was an
existing defect that the consumer wasn't warned about, then the
dealer is still responsible. Aside from that, according to law here,
you've 30 days (or was it 10) to cancel. That aside, practically
all used car dealers here offer 90 day warrantys =')

((I wonder why people in England and Canada have a hard time with people
(getting paid for an honest days work? Could it be their knowledge of
(American English and culture is lacking? Or are their morals really that
(different?)

Getting paid? Who has trouble getting paid? Hell, your country is the

one that doesn't seem to have the bucks to help th unfortunate (welfare).
I doubt there is such a thing as "american" culture (in the true sense
of the word). Morals seem to be different? - I'd say yes. Perhaps that's why
americans rank the highest in the world of "least liked" - the vocal few
that come off as egomaniacal/self-centered/the world should follow us
attitude.

As an aside, what does getting paid in Canada have to do with lack-of
knowledge of American "culture" and American english (if such a thing
exists)- is this yet another example of ego? I would have referred to
it as "New World" english (as does Webster's "New World" dictionary.

Wow, what digression... from lynx packages to culture... to getting
paid... to automobile warranties... morals. =')

K,

(1) What are the advantages of putting the guts of the program in DLLs
and putting the RC files in the EXE.. Or the other way around..
Or better said.. When designing a system what criteria is used to make a
decision about what goes into a DLL & why?

(2) We have a prototype of the program in VB4 16 bit.. We would like to
use this as a front end and use VC 1.52 as the back end.. What is the
best way to do this or is it easier to just do the whole thing over in VC..

This is a 16 bit app only!

(3) What are the considerations regarding DLL & OOD?

(4) Does VB auto unload DLL's when done useing the function?

C is good for GEM aplications true, but it does as easy non GEM games, giving you all the speed and power you need. I am getting the idea you think C is only good for GEM, and that's wrong. C is good for almost everthing, fast arcade games, GEM applications and packers.

> If you're real good at assembly to write a game competely in it, go
> for it! It would be much faster and better if you know how to squeeze
> it out of the system. :)

Knowing how to squeeze the maximum speed out your system is the most important part. Use the wrong technique and even the fastes assembly implementation will make your game fast.

However a high level language around an assembly game is nice. Doing disk acces and memory management is assembly is a hard task and won't bring much speed improvement. I usually write the routines first in C and convert the most time consuming routines into assembley.

Is there any good documentation on how to play samples on the ST/STE/F030/TT? I have read my Compendium but still don't have a good idea of doing it, it states that the ST range have hardware to play sound samples. There are WAV, AVR, SND format of sound samples. So which format does the ST understand?

Appreciates any help to understand this.

Thanks
William

Depends where you are. Hi-Soft handle it in the UK. Of course, first you
have to persuade them to talk to you....

Regards
Martyn

There is another posting in this thread from the author of the Generic
fixer, that should answer all compatability queries, it can and will
be done, see for yourself,

That's another attempt to try and "trip me up" from my own words just
gone down the drain,

 Ho stop crying....:)

>BUT: Why don't you use the higher power of these machines to make more
>redraws or so? Why do you want to kick them back to 8 MHz?

 Ho thats easy...because I havn't got one to test on, getting other
people to test for program compatability is good, but when something
may work differently, at a different speed or have something enhanced
or added, then I refuse to make such a thing without first seeing it
myself,

 hmmm now I think about it ..yes!, if the picture displays then it can
be used in a game, that simple.....

 If you had read the STOS FAQ then you would have known STOS can
handle 24bit true colour, maybe then you would not have looked like a
fool telling everyone in this group that it could not, you did not
ask, you told everyone it could not, tut tut tut

It's known as the "Calamus mentality".

This translates roughly into "I am doing everything myself, irrespective
of whether the hardware already has the functionality".

It is also a hangover from the old days when you essentially had to
program the hardware directly for speed (as the system code was usually
too slow or buggy to rely upon), or added functionality in your app), and
any hardware which differed from what was known when the app was written
was deemed "unsuitable".

>limits.h.

Yep Hans, I wondered if I ought to say anything myself - guess I should have but I couldn't think how to say it in non technical terms yesterday! Here's today's effort ;-) ...

Firstly, people ought to check with their compiler manual. Like any language, there is no guarantee a particular datatype on one compiler uses the same amount of space as the next compiler. 'C' tries to help with this by having certain rules. Basically, the fundamental unit of storage is 'char' - all other datatypes use x amount of 'char' for storage. You can also assume this ...

'short' always uses the same or more space as 'char'.
'long' always uses the same or more space as 'short'.
'int' is either 'short' or 'long' - see your compiler docs for which.

There is a function to help deal with this called sizeof(). It returns the number of 'char' units required to store the datatype, even ones you make up yourself. Thus sizeof(char) is always 1, sizeof(short) is always >= sizeof(char), and sizeof(long) is always >= sizeof(short).

There's still a problem. We do not know how big a 'char' is. This gets into the realm of portability - a complex and vague issue so I'll be atari specific now ...

```
sizeof(char)  = 1 byte.
sizeof(short) = 2 bytes.
sizeof(long)  = 4 bytes.
sizeof(int)   = either 2 or 4 bytes.
```

This little program will tell you how many bytes an 'int' needs in its signed and unsigned states ...

```
main()
{
 printf("6\n",sizeof(signed int));
 printf("6\n",sizeof(unsigned int));
}
```

In almost all cases there will be no problem - the compiler will sort it out for you. Those of you with K&R compilers will have to be a little more careful though because the compiler cannot tell if you are passing garbage between functions.

One area to keep an eye on is printf() and similar functions like fprintf() and sprintf(). A common cause of error is something like this ...

```
main()
{long    l    =5;

 printf("6\n",l);
}
```

Now, this may or may not work depending on your compiler *but* in either case it _is_ 'broken'. There are three fixes ...

```
/* if you really wanted to print a long */
main()
{long    l    =5;

 printf("6\n",l);
----------^------------ long decimal
}

/* if you really wanted to print an int */
main()
{int l    =5;
-^^^------------------- declare it properly
 printf("6\n",l):
}

/* if you want a long printed as an int */
main()
{long    l    =5;

 printf("6\n",(int)l);
---------------^^^^^--- forces the compiler to convert it
}
```

See, just shows how powerful 'C' is - three ways to fix two lines of code! ;-)

No, just a little confusion.

My STOS Falcon extension will load 24-bit TGA images, however they are
converted down to 16-bit for display with standard Falcon hardware. There
is no reason why you couldn't write a routine that would do something simular
to the Apex file viewers from Doug Little to display in 24-bit though.

Ah, but its not /me/. Well, it is now. STOS wasn't written by me,
and the original authors chose to do it the bad way ($FC0000/E00000).
My new version 2.07 which has just been started in beta testing
has had this modified to use _sysbase (I was shocked they weren't
using this). This has been tested on the GEMulator demo with image
files, and seems to work (a couple of minor bugs still to be ironed
out)

> If I boot up MagiC 2 on TOS 1.04 and look at $FC0002 I get $0104,

Oh? I was told this doesn't work... in that case, Magic can now be
done... :)

BTW I dont have any versions of Magic, so this is all second hand
info.

> What certain frequently used routines and addresses are used by STOS?

things like the address of the ikbd handler, line-a graphics routines
and others. Get STOS Fix 2.7/3.0 and it will list all of the routines
it looks for, and the addresses found for your OS.

> Why not divert them to a documented way to access the OS? (I mean the
> trap routines of definatly all atari TOS versions.)

Yea, could do this. I am investigating ways of removing the TOS table,
but not just yet...

> "Using the OS version number to determine the location of undocumented
> variables is not acceptable. You have been warned."

Yea, I know. Looking for AES 4.0 isn't good enough either for testing
for a 'new' AES. - you should use appl_ginfo (or whatever it is) under
Magic/MTOS - despite that this is documented in the Atari compendium and
others as not available until AES 4.0 (magic=3.99). Bad.

Yep.

> That's begging for problems.

Yes, I agree. However,

> As you can create new tables for STOS you seem to know exactly which
> adresses are needed.

Well, actually I am using a (clean GEM based) program that another STOS
hacker wrote a while back. I have no contact for him, and I believe that
he has left the Atari without distributing his source.

> Can't you patch STOS in such a way that the table is filled
> in at runtime?

Not with the routines in use currently - as the routine to detect the
joystick address requires the user to move the joystick. Maybe this code
could be added for unrecognized OS versions...

> So when the program is started first your code is filling the
> tables with the right adresses and after that starting the rest of
> the program?

Yea, I will investigate if this is possible once I have got a couple of
other things sorted. (btw. STOS 2.07 will not corrupt the screen upon
exiting to a Falcon screenmode, so STOS can now be run from 640x480x256
without problems - no need to switch to ST-Low)

You have it - the compendium. If you are writing a nice clean app, then use WavePlay(), and insist they have SAM isntalled. On a Falcon you can use the OS calls - see my WWW pages for info on this. On an STe/TT you'll have to access the hardware registers directly.

> I have read my Compendium but still don't have a good idea of doing it, it
> states that the ST range have hardware to play sound samples.

The original ST[f|m|fm] doesn't really have sample playback ability - it can be done, but is quite tricky. Use STe and above hardware as a minimum IMO.

> There are WAV,
> AVR, SND format of sound samples. So which format does the ST understand?

Tbere is no major diference between the above formats. The main difference is approx. the first 128 bytes - ie. the header info. The actually sample data is stored in the same way (almost) - just the header (ie. the bit which gives the sample name, frequency, midi note etc.) is different.

The ST doesn't 'understand' any of format. If you interpret the header correctly then you can simply set up sample hardware to play the actual sample data.

That wasn't a terribly good/consise description, but I hope it helped a little.

m > In Pure C floats and doubles are the same thing.

You mean doubles and long doubles are the same thing. floats are still 4 bytes.

Even more confusing, sizeof(double) varies depending on the compiler options. Normally, sizeof(double) == 10, but when using the FPU sizeof(double) == 12. The accuracy doesn't change, but the FPU uses the extra 2 bytes during it's internal operations.

Are you sure JAR is freeware?

BTW, it does more than just install a cookie jar. I believe it uses
a function pointer or trap intercept to implement additions and/or
searches. Ask Dan Wilga for details.

```
/* ******************************************************************
                          Install cookie jar
******************************************************************* */
COOKIE = $5A0 ;cookie jar pointer address
SIZE = 32 ;max number of cookies (can be anything)

TEXT
start:
 pea init(PC)
 move.w #38,-(A7) ;Supexec(init)
 trap #14
 addq.l #6,A7

 clr.w -(A7)
 move.l #SIZE*8,-(A7)
 move.w #$31,-(A7) ;Ptermres(SIZE*8,0)
 trap #1

init:
 lea start-256(PC),A0 ;use basepage for cookie jar
 move.l A0,COOKIE
 clr.l (A0)+ ;initialize cookie jar
 move.l #SIZE-1,(A0)
 rts
END
```

```

There is, however, a switch in Lattice (and in GCC for that matter) to make an 'int' 16 bit.
(WARNING! The Lattice C optimizer often does some incredibly stupid things when it tries to optimize code which uses 16 bit numbers. You might even be better off with no optimization at all...)

The range for a 16 bit (2-complement) number is -32768 to +32767, by the way.

Normally, an 'int' should be the 'natural' integer type for the machine in question. Unfortunately, the older members of the Motorola 68k series (like the 68000 in the STs) are only 16 bit internally (except for the registers), while having a 32 bit instruction set architecture (ISA). This is probably the cause for the confusing compiler differences.
(The PCs with their 80x86s have the same problem.)

```
> > long integer      |   long     |  4 bytes        | Whole numbers

> >                                                  | +2,147,483,648
>
>Same thing here, a long is at least 32 bit, bit it can also be bigger, like 64
>bit on a Alpha processor.
```

And again, the second range figure should end with a 7.

```
> > character         |  char      |  1 byte         | non numeric values
```

'non numeric'?
There are lots of cases where it's very useful to use characters in the same way as any other number type. C makes no distinction.

```
> >                                                  | -128 to 127
>
>Compiler specific, some compilers use unsigned chars by default, other use
>signed chars by default.
```

And many can change that via a switch.

Also, a character may well be longer than 8 bits. You won't find any Atari compiler where that is so, though.
(I've heard of 9 bit and 64 bit character machines, but those are not something I would worry about. ;-)

By the way, you forgot to mention 'short' (perhaps not very surprising if you're using a compiler that has a 16 bit 'int' ;-).
'short' is at least 16 bit and no longer than an 'int'. On machines where

the latter is 32 bit, 'short' is often 16 bit to make a more space
efficient type available. It can be slower to do calculations with 'short',
though.

Length of char <= short <= int <= long.

(GCC also has 'long long' which is 64 bit, but that's not standard.)

What tokens do strtok() return (add a puts(p) in the loop)?
I mean, does it get past your '\0' after having considered ' line1 '
and ' line2]' tokens?
(Wouldn't you want to include ' ' as well and break up at ']'?)

If the second token is indeed what I wrote, it appears the strtok() needs

more than one '\0' to stop and you're just lucky to have an extra one after the string. That would of course make the strtok() quite buggy!

You should find sources for strtok() in the GNU libraries.

...but shouldn't if you only use the specifiers mentioned here.
(%c, %d, %f)

>program to see what happens. Another question you probably have is: why

In case there's someone here who doesn't know very much about how computers
(and C in specific) work internally:

C has _no_ way of knowing whether you actually passed the floating point
or whole number you state with your specifiers that you want to display.
Therefore, printf() can not convert the float 3.14 into the whole number 3
for example and a line like

```
  printf("Pi=%d", 3.14);
```

will print gibberish.

The vast majority of C functions you will ever write and use can not handle parameters of varying types like printf(). Without the specifiers, printf() wouldn't have any idea about what, or even how many, numbers you sent it.

>are character values stored with whole digit numbers from -128 to 127.
>The answer is that the numbers correlate to letters using a lookup table.

In case someone wants to know about the 'lookup table', the Atari machines use a standard called ASCII (American Standard Code for Information Interchange) as do most other modern computers.
This covers the English alphabet, numbers and the normal special characters.
For foreign and other special characters, the numerical codes may differ.
(The normal standard only covers the character codes 0-127.)

>Try adding the following code to the above program:
>
>printf("\n %c%c",72,73);
>
>In the above line of code I didn't give printf() a character that the
>format specifier %c calls for. Instead I gave it a whole number.

I think it should be mentioned that C does not really have characters in the usual sense (for example BASIC). 'A' may look like a character to you, but C will only interpret it as the _number_ 65.

As I guess will be seen later in this course, C has no strings either.
Instead you use functions that operate on lists of numbers under the assumption that they are strings.

The rsrc_gaddr() function *does* work entirely as specified in the GEM documentation - that is, it will find any of the specified objects in a resource file, given that you have their index.

As I don't have the article that started this thread, I can only guess that what you want to do is change the te_ptext field of the TEDINFO structure.

The TEDINFO structure may be found by:

```
  (TEDINFO *)(tree[obj].ob_spec)
```

This may then be dereferenced to obtain the te_ptext field:

```
  ((TEDINFO *)(tree[obj].ob_spec))->te_ptext
```

te_ptext is simply a pointer to a C-style string, and may be altered or manipulated as you see fit. I seem to recall that there may be a text length field in the TEDINFO structure... but I can't quite remember (my documentation is in my hall of residence, and I'm sitting at a Sun Sparc machine typing this).

I know this sounds *really* nasty, but you could try modifying

the active process system variable (in the OSHEADER structure)
to point to the basepage of the accessory, then using malloc()
or mfree() (or whatever), then setting it back to whatever
it was to start with. This should ensure that your accessory
owns the memory. It may work for file handles as well.

The thing is, I haven't tried this, and I don't know whether
it works, but if it does work on non-multitasking systems
(which are, after all, the only places where it would be
used), why not do it?

I run a 660C (about a year old) on a Falcon. No problems in this
department but I seem to remember it only affected some STs.

> Now HP has the fancy DOS/Windows GUI control panel for their newer models. Does
> this eliminate those models from being used by Atari STs?

No they work fine. The only problem is that it is almost impossible to
change the factory settings since there are no dip-switches. This is a
problem mainly in Europe since the paper size defaults to American
Letter rather than the European standard A4. It makes about an extra
inch at the bottom of each sheet unprintable.

Hope this helps

Regards
Martyn

Where are the 24 bit sprite routines? And 24 bit drawing routines? My guess is there are no language extensions yet that work on true color (24 bit) graphics cards. So you are talking and thinking a bit too simple now. I even wonder if a STOS program like this will work on a true color card in an ST (or TT ot Falcon or ..).

```
10 print "Hello world!"
20 end
```

The constant CHAR_BIT in limits.h tells you how many bits there are in a char.
Usually it's eight.

```
>
> sizeof(char)    = 1 byte.
> sizeof(short)    = 2 bytes.
> sizeof(long)    = 4 bytes.
> sizeof(int)    = either 2 or 4 bytes.

> printf("6\n",sizeof(unsigned int));
> }
>
```

Well Mr Harrisson, you made a mistake overhere, this program will print when
compiled and runned:
6

Not very usefull I think. Let's do it this way...

```
#include <stdio.h>

int main(void) /* main has to be of the type int according to ANSI */
{
  printf("%i\n", (int)sizeof(signed int));
  printf("%i\n", (int)sizeof(unsigned int));
  return 0; /* exit succes */
}
```

The operator sizeof() has an result of the type size_t, the type of size_t is compiler dependent. That's why I cast the answer to an int.

> In almost all cases there will be no problem - the compiler will sort
> it out for you. Those of you with K&R compilers will have to be a
> little more careful though because the compiler cannot tell if you
> are passing garbage between functions.

For those who don't know: there are two main streams in C compilers, the older K&R compilers and the newer ANSI C compilers. The main advantage of ANSI C is that there are function prototypes, so the compiler can check wether you are passing variables of the right type to a function.

The K&R compilers are called K&R compilers because the compile C the way it was defined in 'The C programming language' by Kerninghan and Ritchie. ANSI C compilers are implemented according the ANSI C standard. A good book about ANSI C is 'The C programming language, second edition' by
Kerninghan and Ritchie.

Those books by Kerninghan and Ritchie are usually reffered to as K&R. To avoid any confusion about which book you are reffering to you can use K&R1 and K&R2 for the first c.q. second edition.

Eh??? It's well defined where the joysticks are. They are in the keyboard. The ACIA will receive a joystick packet when a joystick is used. (First byte comming from the keyboard is $FE for joystick 0 and $FF for joystick 1, the second byte has in bits 0-3 the four directions and in bit 7 the firebutton status.)

Why didn't you include assembly in this thread? It's even harder to do a game in assembley then in C. So there was no danger to include assembley too in the thread, because it's far easier to program in basic then in assembley.

No Tony, I think you are moving the goal posts here. C is the better choise for game programmers because you can do better games in C then in STOS basic. There was never anything about ease of use and suitable for starting game programmers.

Those arguments came when it became clear to you C could indeed do a better and faster game then STOS.

Do you remember you asked me to SHOW you a game written in C that was better then STOS? This clearly means to me you were interested in the results of the programming language, and not in how hard or easy it is to write a game in that particular language.

 You don't win sweet FA until you show me a good game written in 96 in C....and that cannot be done,

 so C loses the argument, the debate and the whole thread, and you have what we call "Egg on your face" for shouting you win, it is pathetic to think you can win a debate like this with unproved arguments,
 All you C coders that have entered this debate (other BASIC owners wimped out!) are full of talk, too busy talking to prove your arguments with code...pathetic

> > ...actualy the thread is best BASIC or C to choose

snip

>Why didn't you include assembly in this thread? It's even harder to do a game

 eh?, because we already know that asm is best?...how many people are
going to learn asm to make a game, the worry for most people is that
after taking all the time it needs to learn asm, then be good enough
to make a game, will there be a big enough audience left?

 But I could show someone with NO programming knowledge , how to make
a good game in a fraction of the time, most of my time learning to
program has been taken up with lots of trial and error, I could now
pass on the...well you know :)

>No Tony, I think you are moving the goal posts here. C is the better choise for
>game programmers because you can do better games in C then in STOS basic. There

 eeerm we don't know that yet, you showed me a demo of a game, this
looks like it will be better, but is not yet?, it is also not fully
compatable, your main argument has always been compatability, you
showed me what could be good, you have not yet showed me anything
BETTER than heartland,
 I stopped asking you to show me so you had a chance, but YOU are
bringing this up again,

 You have not shown me anything better than heartland, only shown me
something that could be better? until you do then maybe you better
stop saying C is better for making games than BASIC before you start
looking silly?

Cheers.....!ynoT

Hi Bill,

the STE/TT/Falcon range can playback AVR sounds at unstandard Atari-specific frequencies. WAVes can also be interpolated by some softwares, but ultimately, AVRs recorded at 6, 12, 25 or 50KHz are what works on Atari machines equiped with DMA sound support. A place to start is to get the System Audio Manager. It was included on Falcons delivered with internal HDs and it will also work with STE/TT. SAM installs a cookie and enables the Waveplay() command for calling AVR playbacks on programs.

Try to see if you can locate SAM and the developers kit or if you cannot source it locally, e-mail me back. I'll see what I can do about e-mailing you a copy of both along with some AVR utilities for converting AVR to WAV or AIFF. Good luck!

Regards,

Depends on the compiler. MWC uses the DECVAX format where
sizeof(float)=4 and sizeof(double)=8. Most MWC floating point
functions use double as arguments for the extra precision.

But who wants to use floating point anyway? <G>

Take five minutes to read this and it WILL change your life.

I've been a fool so far. Yes, I admit it I've been a fool. I've been doing this on local BBS's for the last 2 years. I've been getting about 40 to $50,000 a year if that. I tried it the net 3 weeks ago and I wouldn't believe it! Not just a little each week (barely enough to keep my head above the debt), but tons, I mean big bucks! In the first week I got three hundred dollars, then a week later, a couple of thousand, and by the end of the third week, I had recieved nearly $32,000.00.

It's REALLY SIMPLE to do too!!!

Here's all there is to do:

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST."
(In this way, you're not just sending a dollar to someone; you're payingfor a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1-Sam Coice
25550 Buckthorn Ridge Rd
Pioneer Ca 95666

2-Peg Vickmore
14905 Highway 88
Jackson, Ca 95642

3-Brian Hyson
4278 Sayoko Cr
San Jose, Ca, 95136-2335 USA

4-Daniel Hanlon Jr.
6001 Fox Run
Fairfax, Va 22030

5-Joe Munchak
13535 Union Village Cir
Clifton, Va 20124

STEP 2.

Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP 3.

Post the article to "at least" 250 newsgroups. Rembering that the more that you post on, the more people see it, and the more you will get. There are at least 30,000 newsgroups at any given moment in time so don't be stingy.

STEP 4.

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back about 5

responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

> END
```

Personally, I wouldn't overlay the new jar over the existing basepage of the TSR. I'd rather Malloc() a block of RAM (sizeof(current jar + 8 cookies), as is reccomended) which will remain allocated and owned by the TSR when it goes resident.

And, you have missed out the "unjar" code which should be executed during system reset.

Does there exist a "Canonical List Of TOS Bugs"?

If so, where? How big? And, more importantly, how up-to-date is it, and who maintains it?

Hi everyone,

I am currently trying to set up a cross compiler to produce atari bins on a i586 based Linux system. Has anyone got some experience in setting up cross compilers, because I could use some help...

I use an i586 based PC (sad but fast) running Linux 1.2.8 (temporary, until I fix GCC to run with a 2.0.24 kernel) and GCC 2.7.2 as a host, and a Falcon 030 running FreeMiNT 1.14.2 as a target (although I have configured the GCC cross compiler to make plain 68000 binaries)

I am using the following (Atari-) packages ("*" running on Linux, "o" on Atari)

* GCC 2.6.3 for MiNT (patched source tree)
  configured using ./configure --target=m68000-mint

o GCC 2.6.3 for MiNT (binaries used for compiling libgcc1.a on my Falcon)

* Binutils 37 (3.7? or 0.37? or 0.3.7? or pl37??)
  (sources by J.Bammi, pretty old I think...)
  compiled using Makefile.cross with -DBYTE_SWAP and -DWORD_ALIGNED
  (came in a .zoo file called utlsrc37.zoo)

o Binutils (unknown version, no docs. I think it's 37 again...)
  (binaries, to use with GCC binaries)
  (came in a .zoo file)

* GAS 1.37 pl 4 (I think) (sources from J.Bammi)
  (came in a *%#$@&! .zoo file called gassrc04.zoo)

o GAS 2.x (don't know the exact version)
  (binary, to use with GCC binaries)
  (came in a .lzh file called gas2<something>.lzh)

I also have the libgcc.a from the GCC Atari binary distribution and the Assembler sources for libgcc1.a for Linux68k, although I think these sources use the FPU, which I don't have...

Problems (list of 2 Gb follows :-) :
---

* Atari Binutils compiled for Linux won't recognise object file format
  produced by GCC binaries on Atari. "ar" _does_ handle the archives.
  (Atari Binutil binaries running on Atari _will_ recognise obj format)

* GAS 1.37 only supports 68020 + FPU

* GAS 2.x bins are compiled for 68030 + FPU according to docs,
  but seems to work fine on my Falcon without FPU.

* I'm not sure libgcc1.a was made correctly, since I couldn't use the
  Makefile

* The GCC make process aborts _after_ having handled libgcc1.a, because
  libgcc2.c and a few other things won't compile correctly.
  I think this is either due to faulty (cross-)Binutils or due to
  a faulty libgcc1.a

So I guess I will need at least the following:

* Source distr of a GAS which can output mc68000 TOS binaries

* Source distr of Binutils that can handle object files compiled by
  GCC 2.6.3 for Atari (OR patches for the GNU Binutils to implement
  a m68000-atari or m68000-mint target)

* A libgcc1.a for m68000-mint (in case the one I compiled isn't any good)

If anyone can help me with advice or by telling me where to get some of
the stuff above, I would be very grateful...

Thanks for reading...

I see the stos vs c vs assembly argument is still going on, my view is
if a game is fun does it realy matter what language it was written in.

this comment is more directed at the people who dont beleive stos games are
good at all, I have found several games written in stos/amos to be quite enjoyable
and people shouldnt judge a game but how it was programmed(if its fun)

correct me if im wrong but i beleive Ultima I and Ultima][were written
primarily in
basic with a few assembly routines(original apple versions) and even by todays
standards
I find both of these games to be in my top 10 list of games ever.. along with
Starfleet I from interstel which the ibm version was written in basic, have the
sourcecode
and no assembly calls made. the atari/amiga and mac version i beleive was
rewritten in 'c'

as i am now only getting in to the atari scene, what is the best version of c
for the atari, ive used lattice c on both amiga/ibm.

I think the ALU of the 68000 is only 16 bit, register to register addition of a long take 8 clockcycli, while a word addition only takes 4 clockcycli. So I think that Johan Klockars is right with his statement.

Has anyone with a TT use a patch program called TT GAME which makes the TT play ST games?

I downloaded it from a BBS sometime ago to look at it, just to see if I

can get a game I'm writting to run on a TT. I still have STOSfix 1.1
which supports TOS 3.x on the TT so I'm wondering...

If the thing works, then might be good playing ST games on DirecT/40 or
Medusa...especially if it has a PC card for running Windoze 95 and DOS
games as well :)

I've been using an HP Deskjet 600C with my ST for over a year, and it
performs very well, with a standard cable.

Visit the Deskjet WWW site for more information.

It is a joke, obviously a bad one if you didn't get it. :(
I was refering to the babylonic mixture of languages described in the Bible... :)
That assembler (described in the first article of this thread) allows to mix x86 and
68k like opcodes.

Greets,
Phil.

Great, this'll make the C newbies believe that int, regardless of machine, is always 6 bytes ... ;-)

They should better try :

```
main()
{
   printf ("  Signed Int is %d bytes\n",sizeof(signed int));
   printf ("Unsigned Int is %d bytes\n",sizeof(unsigned int));
 }
```

Reading all your other lines, each missing the format specifier, but all having a `6' I guess you have trouble uploading the `%' character ?

Cheers Peter

> (The PCs with their 80x86s have the same problem.)

This is wrong. Even the 68000 is 32 bit internally. Instructions like
adding 32 bit numbers would take far more time if this were not the case.
Turn it around, then it makes more sense : The MC68000 is a full 32 bit
processor that has a 24 bit address and 16 bit data bus interface. The
notion of the 68000 being 16 bit architecture was only stated by Intel
fans at the time who could not stand that Motorola had the more advanced
CPU. I quote the Valvo databook :

DESCRIPTION
The SCN68000 is the first implementation of the S68000 16/32 bit
microprocessor architecture. The SCN68000 has a 16 bit data bus and 24
bit address bus, while the full architecture provides for 32 bit address
and data buses. ...

Got it ?

Cheers Peter

Yes, but this is only because Pure C treats the floating point stuff
separatly. You very likely linked a printf() version that is not capable
of %f, %g and others. In case of Pure C you need to use the PCFLTLIB for
floating point support, and then even this grows bigger. This behaviour
is not all to common, most compiler's libraries only have one version of
printf(). On top of all this : Yes, the GST linker is probably not very
smart, but this makes not much difference here.

No, the Pure Debugger works brilliantly under MagiC's preemptive multitasking.

Doesn't cause harm. However one of the many bugs with normal TOS leads to
the situation that an edit field filled with underscores is shown, which
is the same as an empty field but the cursor is at the end.

I use MagiC too, and I'm pretty sure I used the trick and it worked under
MagiC ...

> MagiC for your ST and Gemulator and a MagiC PC demo.)

Right... as of 45mins ago it can probably be fixed for all true Atari
versions of TOS. I will add Magic code soon, hopefully...

Now, discounting this new (currently unreleased) version of the
interpreter/compiler, I shall explain...

The reason STOS doesn't work with Magic is simply because magic needs
a different set of values in the table of addresses. Obvious. Now,
STOS doesn't know about magic (written before it was released), and
so only checks the TOS version - not the AES version. Thus, a Magic
based machine appears to be the TOS version of the original TOS.
(definately true for Magic 2 - it returned 1.62 on an STE when tested.)
This makes it impossible to have values for both Magic and TOS in
the same table - the same OS version.

Now, the reason that STOS doesn't work with TOS images is due to the
VERY wierd way that STOS found the OS version. This is now fixed in
my latest compiler mods, so hopefully this problem is resolved. (yet
to be tested). There may also be problems with the contents of the
tables - I'm looking into these...

> Now here's the question: Can you or can't you fix it?

Yes. Not necessarily in a way that it will work with all OS's at once
(without my new code), and definately not with image files...

> A much more important point: _WHY_ must you patch the STOS compiler?

Good question... someone thought that it would be a good idea to have
a table which had offsets (?) to certain frequently used routines
and addresses so that they could easily be found by each different
module. (STOS is written in a VERY modular way... Dynamic linking,

effectively... not bad fo 1987)

Anthony

It's been a long time since I've done any ST programming, but from what
I remember of the cookie jar protocol, a program that utilizes the
cookie jar but does not find one on the system should CREATE the cookie
jar and install it.

Assuming the the programs you wish to run don't do that, I think there is a cookie jar CPX that will do this. Otherwise, find a TSR that will install the cookie jar for you and run it first.

None at all as far as I know. My own library routines walk the trees and replace the '@' with NUL on startup and I've had no complaints!

Mask in the SMALLER attribute to wind_create().

When you click on it you'll get this message ...

msg[0] = WM_ICONIFY
msg[3] = window handle
msg[4,7] = area of iconified window (ie do a wind_set())

and the reverse is ...

msg[0] = WM_UNICONIFY
msg[3] = handle
msg[4,7] = original area (wind_set() again).

A CTRL click will send you WM_ALLICONIFY if you want to bother
implementing it.

Sorry, I haven't got the actual values to hand. :-(

```
g > p = strtok(s,"|");
g > while (p) p = strtok(NULL,"|");
```

I'm not sure what strtok(NULL,"|") is supposed to do (other than cause a two bomb error). This usage is certainly not in my ANSI C reference.

However, it works fine with Pure C, stopping at the right spot.

No, Toad is not the ONLY company. Computer Direct is pretty well exclusively devoted to TOS and MagiC platforms. Toad is hyping their PCs (with Gemulator built in) and their Internet service provider business. They still sell Atari stuff, and provide support, but appear to be winding down their involvement in the world of TOS computing. Computer Direct, on the other hand, will only sell you a Mac or Mac Clone if you REALLY insist, and steadfastly refuse to have anything whatsoever to do with PCs. Check them out at http://compdirect.com. They are doing some really amazing stuff.

Bill Merik
VERY satisfied Computer Direct customer and beta tester.

In my first writing of the introduction, I was under the impression that a certain unnamed BASIC was free, which in fact, it turns out is not free.

However, with most computers, C64, Atari 800 or MS-DOS, have a free version of BASIC included (Commodore BASIC, Atari BASIC or GW BASIC) what have you...If there are free versions of C for TOS, then PLEASE, seriously PLEASE tell me where to find them so I can test my programs on this compiler and tell all those people who do not have compilers where they can get one. That will solve some of the problems related to this tutorial.

As for your other comments, I'm not going to argue with them, the fact is there are some good points in your posting, and .... C and C++ are related languages, obviously, but the concept of programming object

oriented code places an emphasis on different skills...in any event so few Atarians have a C++ compiler that the point is moot.

Yes, feel free to clarify,

Yes, Megamax is out of business. I am not current on all of the Atari issues, so please jump in when I stick a foot in my mouth.

I thought most compilers would come from a company that has since abandoned the Atari platform since Atari has abandoned the Atari platform...

If you find a company that has active support, I would choose it over Megamax anyday.

Thanks for your help.

Lesson 4 - Variables and printf();

OK, in lesson 3, you were introduced to the world of printf(). Today, we are going to learn about variables. We will then demonstrate the use of variables with printf().

Variables are a basic component of every computer program. Variables are used to set aside a portion of the computers memory. This portion of memory is then identified by an easy to remember name. This name is assigned when you define the variable. I'll give you an example. Let's say that I added the following line to a C program:

```
int lives;
```

What I've done is told the compiler that I will be using a variable, and that the name of this variable will be 'lives'. Also I've told the compiler that this variable will be an integer. (whole number)

In C you cannot use a variable unless you first define it. This is because the compiler needs to know exactly what type of data is going to be stored so it can make the most efficient and logical use of memory.

In the above example 'int' told the compiler to set aside space for an INTeger variable and that the variables name is lives. We are now ready to use the variable. We can assign a value to this variable. We could add the following line to our C program:

```
lives = 4;
```

With this bit of code we have assigned the integer value 4 to the variable lives. To save some time, most compilers allow you to combine the two

example C statements into one, thus:

```
int lives = 4;
```

Another shorthand is to declare more than one variable of the same type at once:

```
int month, day, year;
```

That does it for this lesson. I'm sure you all still have some questions. For example: what happens if you mismatch format specifiers? The answer is C will do its best to interpret the variable in the format you requested. Try experimenting with the format specifiers in the above program to see what happens. Another question you probably have is: why are character values stored with whole digit numbers from -128 to 127. The answer is that the numbers correlate to letters using a lookup table. Try adding the following code to the above program:

```
printf("\n %c%c",72,73);
```

In the above line of code I didn't give printf() a character that the format specifier %c calls for. Instead I gave it a whole number. Printf() will not display the number, but instead display the character the corresponds to it!

OK, we've covered a lot of ground in this lesson and there are bound to be many questions generated. Please post to this newsgroup with your questions. I am going to pause for a week and give everyone time to digest the material.

NEXT LESSON: The next lesson will be posted January 11th and will cover operators.

Format Specifier	Use
%c	single character
%s	string
%d	signed decimal integer
%f	floating point in decimal notation

Got all that?

Lets put what we've learned together with a program.

Project: Write a program that uses variables to hold information about the number pi and the number of sides of a triangle.
Answer:

```
/* Lesson4.C */
/* This program demonstrates the use of variables and format specifiers */

#include <stdio.h>

main() {

     int sides;
     float pi;

     sides = 3 ;
     pi = 3.14 ;

     printf("\nThe value of pi is: %f",pi);
     printf("\nA triangle has %d sides.",sides);

     getchar();
    }
```

When you run this program, pi is displayed as 3.140000! That is not

correct of course, but without anyfurther information printf() assumes that a float value should be displayed to six digits of precision. We can correct this problem by either defining pi to six digits or by providing printf() some additional information which will tell it to display the variable to only t digits of precision. Try the following line of code:

```
printf("\nThe value of pi is: %.2f",pi);
```

The ".2" tells printf() to only display two digits after the decimal point.

There are other variable types besides integer. The following chart shows some of the common types:

(*Chart deleted -see post named C Tutorial Chart- sorry about not including it here but America Online has disconnected the connection the last 10 times I tried to send this page*)

Got all that?

For now, I recommend using 'int' when you need to use whole numbers (used when you need to count something). Use float when you need a measured value. (example : float wage = 8.82;) And char for character values. (example: char grade = 'A';)

Question: Can't I just make things simple and use float all the time?
Answer : No. Because of the way variables are stored in memory, this is not a good idea. Use 'int' for counting. Otherwise you will end up in the same predicament as government statisticians...that is with 2.4 children and owning 1.5 cars. It will become clear as you program more and more, why using the wrong variable type can have amusing consequences.

OK, you all understood lesson 3? In lesson 3, you were introduced to printf() and we covered two FORMAT SPECIFIERS. They were %s and %d. There are many format specifiers. There are specifiers for scientific

notation, octal, and hexadecimal, among others. The following chart shows four common format specifiers. For the purpose of this tutorial I will only introduce new format specifiers as they become necessary.

Find the next token in s.

```
>This usage is certainly not in my ANSI C
>reference.
```

Kernighan & Ritchie:

A sequence of calls of strtok(s,ct) splits s into tokens, each delimited by a character from ct. The first call in a sequence has a non-NULL s. It finds the first token in s consisting of characters not in ct; it terminates that by overwriting the next character of s with '\0' and returns a pointer to the token. Each subsequent call, indicated by a NULL value of s, returns the next such token, searching from just past the end of the previous one. strtok returns NULL when no further token is found. The string ct may be different on each call.

YOU have to follow and understand the thread before you jump in with your size tens shouting "rubbish" at me,
The thread is best BASIC for making games, with C thrown in, we ALL already know assembler is tops, only a fool would say STOS or C is better, IF you had followed the thread then you would have understood the context of the statement, just like everyone else did, nagh na na naaa nagh ;--)
You have the wrong end of the stick, <smile>

Errr... the culprit is not C, but a combination of C++ [more object oriented (and "buzzword compliant"), but slower than C] and Widows [like a snail pulling a locomotive through near-frozen treacle]. Oh, and the extreme register starvation and tedious instruction set of Itel processors.

Time to throw away your ANSI C reference, because it is certainly ANSI C.
strtok is a function to tokenize a string, that is the string is cut when a separator is found. The second parameter is a string with separators. The first time you call strtok the first parameter is the string that has to be tokenized, the result is the first part of the string. All
subsequent calls of strtok() with as first parameter NULL will give the second, third etc. part of the string.

According to my knowledge Intercon96 was a (computer) party organized from 1-3 November by Inter, TSCC and New Trend. I think it was somewhere in Germany.

Wow, an assembly die hard? I think it's easier to write the game in C and then optimeze all parts that take too much time in assembley. SO you can use C for memory management and disk io and getting raw speed for the graphics parts.

 > getting at all the big companies that use C and such like instead of

Most of those big companies you talk about are writing games for intel x68 processors and there is absolutly no joy found in doing assembly for that type of processors.

A table with frequently used functions and adresses is no problem, as long as you fill in that table at run time. The weird part about STOS is that it the table has to be filled in at compile time and the program is trying to find out which table has to be used when the program is started. That's begging for problems. As you can create new tables for STOS you seem to know exactly which adresses are needed. Can't you patch STOS in such a way that the table is filled in at runtime? So when the program is started first your code is filling the tables with the right adresses and after that starting the rest of the program?

 >                                                  | +32,768
```

Ho, stop, now we are in compiler specific things. Time to grap the ANSI standard and correct a few things.

An int is guaranteed to be 16 bit, 32 bit many compilers, like Lattice C, use 32 bit ints.

```
 > long integer      |   long     |  4 bytes        | Whole numbers
 >                                                  | -2,147,483,648 to
 >                                                  | +2,147,483,648
```

Same thing here, a long is at least 32 bit, bit it can also be bigger, like 64 bit on a Alpha processor.

```
 > floating point    |  float     |  4 bytes        | Measured values
 >                                                  | +/- 10E38
 >                                                  | 6 digits of precision
 >
 > double float      |  double    |  8 bytes        | Measured values
```

```
 >                                                    | +/- 10E308
 >                                                    |15 digits of precision
```

Same thing here. In Pure C floats and doubles are the same thing. The minimum number of digits of a double is 10. The minimum value of a float or double is at least 10E-37, the maximum value is at least 10E37

```
 > character         |  char      |  1 byte         | non numeric values
 >                                                  | -128 to 127
```

Compiler specific, some compilers use unsigned chars by default, other use signed chars by default.

All quoted values come from my copy of K&R2, not from the real ANSI standard, but there aren't much differences between K&R2 and ANSI.

The exact minimum and maximum values of all these types can be found in limits.h.

Yep, I have one. It comes with a complete unix string library, that is all ANSI string functions plus some extra like strend(). The library is under GNU licence so no problems with copying it including the source. It comes with all functions in C, discription of those functions and a 68000 assembley optimized (by me) version of most of the functions. In the library is also an complete printf() function with al its diveratives and called functions (and it are less than 42 in this library, especially if you use the assembley optimized version, because most called functions like strlen are included in the source for the sake of speed).

The library is about 2Mb, but this includes all documentation. I can pack it down to a 340 kb file. I can mail it to you if you like.

Crossfire
PC 80x86/68000 hybrid Macro Assembler

If you want a 68k assembler or pine for the 68k chip then read this

A friend has written an assembler called 'Crossfire' which supports both 680xx and a modified form of 8086 (actually 80386). It needs a 386 minimum but I guess thats no problem these days.

With output both for 68k and 80x86 - its goal was two fold:-

1) To allow you to write 68k programs using a PC for running on a 68k machine - (NOTE: It does not allow you to run them on a PC) The pattern was DEVPAC which it now surpasses IMHO.

2) To write 68K alike programs on the PC. Using predominantly 68k instructions and address modes, but 80x86 registers it is very similar to writing 68k code especially PMODE code (which is the preferred method)

; a nonsence example (and the .X's are not necessary - just habit)

```
     move.l   [esi],eax
     lsl.l    #1,eax
     move.l   eax,[edi]
     add.l    #4,edi        ; no post increment (YET!)
     swap ebx      'pseudo op'
     clr.w    bx        'pseudo op'
     tst.w    ax        'pseudo op'
     beq.s    .skip
     not.l    eax
.skip    bsr  fred
     rts
```

That is not to say that a 80x86 programmer would be lost using Crossfire.

It is not all things to all men - the dedicated 80x86 programmer would perhaps not appreciate some of the features. If you have 68k'ed at one time and perhaps pine for those times this could be for you, or maybe not - the extra modes, instructions and methods are optional - you can even mix styles, though as you can imagine this looks rather messy.

NOTE: I will not dwell on the basic 68k mode - it's just that - more than a match for most. Suffice that it has Nested Macros, INCLUDE, INCBIN, local labels, string handling, opcode overides, repeat loops, conditional assembly etc....

It is modified in the respect that it is geared for the 680xx programmer wanting to write 80x86.

Some of the more important features are:

* allows operand reversal (for 68k alike):-

```
Conventional  8086          mov  al,5
    reversed      8086          mov  5,al
```

* allows 68k instructions

```
     'MOVE' as well as 'MOV'
     'Bcc'  as well as 'Jcc'
         + many others
```

* optional pseudo instructions + address modes

```
     'CLR.W  [eax]'
     'TST.B   DL
     'MOVE.B  3[ESI],2[EDI]'
     'SWAP'
```

* Uses .B/.W/.L/.D rather than byte_ptr word_ptr etc

```

CrossFire Assembler, By Mark Parry
80x86.DOC

This document explains the Intel 80x86 processors/instruction set from
the perspective of a Motorola 680x0 programmer. It is not a intended
as a complete guide to programming the 80x86 range of processors. You

should also look at the document "FILETYPE.DOC" to see how various
output file formats are supported, especially for types ".COM",
".EXE", ".SYS" and ".EXL".

Introduction

The reason for CrossFire? Originally, I wanted to write a 680x0
assembler on the PC, to take advantage of the much faster processor
speed. I could of probably have coped with the annoying quirks of PC
assemblers, but I could just not get my head around the opposite
syntax of the instructions. For this reason, I had to write an 80x86
assembler that I could work with. CrossFire's version of 80x86 is as
close to 680x0 as I could make it.

Example: store value (41 hex) in memory on different
assemblers

```
MOV  BYTE PTR [BX],41h  TASM/MASM/etc.
MOV.B    [BX],41h      XFire 80x86 (normal
syntax)
MOVE.B   [BX],#$41     XFire 80x86 (normal
syntax)

MOVE.B   #$41,[BX]     XFire 80x86 (reverse
syntax)
MOVE.B   #$41,(A0)     XFire 680x0
```

Being used to programming the 68000, it was a major culture shock
switching to the 80x86. The assemblers do not help, they seem to be
lumbered with a lot of unnecessary and awkward features.

I don't like having to keep modifying segment registers. Earlier
versions of the assembler had to, and it was a nightmare. To try to

make life easier for myself, I now program the 80x86 in one of two ways;

If all the code, data and buffers will fit in 64k, I can write the program in a 16-bit segment. ('.COM')

If code, data and buffers will not fit in 64k, or I need to use expanded memory, I will use a DOS extender and write the program in a 32-bit segment. I now tend to write all programs using this method,as I have a library of routines that handle memory, input, output and files. The DOS extender seems very stable, and works under DPMI, VCPI and XMS. ('.EXE')

A 32-bit segment works similar to the 68000. With reverse syntax and the equivalent instructions (the branches, set conditionally, shifts, CLR, TST, SWAP, etc.) 80386 code can look remarkably similar to 68000.

I find 68000 branches, set conditionally and shifts more logical, and CLR, TST and SWAP make source code more readable. Using MOVE/MULU/MULS/DIVU/DIVS/ADDX/SUBX/JSR/EOR/EXG instead of MOV/MUL/IMUL/DIV/IDIV/ADC/SBB/CALL/XOR/XCHG are just a matter of preference.

BTST, BCHG, BCLR and BSET (only with an immediate bit number) have been included from before 80386- instructions were added. However, I still only use BT, BTC, BTR and BTS if I use a bit field or a register bit number. xBCHG, xBCLR and xBSET are included because they take less than half the bytes of BCHG, BCLR and BSET (but they do not set the flags properly). xBTST is included for parity.

Use of the extra instructions is optional, all of the 80x86 instructions can still be used (I like having the choice). However, BSR (bit scan reverse) and LSL (load segment limit) have been renamed (@BSR and @LSL), because of the 680x0 instructions BSR (branch to subroutine) and LSL (logical shift left). BTTST (BT), BTCLR (BTR), BTCHG (BTC), BTSET (BTS), BTSF (BSF) and BTSR (@BSR) were added because I prefer the syntax.

I tried to make the assembler as flexible as possible. There are a lot of duplicate instructions, and the same address mode can be specified in a number of ways. There are a lot of ways to do the same thing, for example :-

```
LODSD = LODS.D = LODSL = LODS.L
[BX] = (BX)
CS:[BX] = CS:(BX) = [CS:BX] = (CS:BX)
offset[address] = [offset,address] = [offset+address]
$12 = 12h = 12xh
$ABCD = 0ABCDh = 0ABCDxh
%100 = 100b = 100xb
```

Although the assembler will recognize round brackets on 80x86 address modes, (BX) is considered the same as [BX] for example, you can only use square brackets for direct memory addressing; [100] is allowed, (100) is not. It is therefore recommended that you use only square brackets for 80x86 address modes.

```
ÚÄÄÄ
```

- The file continues.....

Now the thing is with all this is :-

The assembler is very much finished in the sense that we use it all the time, but more output filetypes and features could be added but as yet we don't have any use for them. Constant use means fewer (if any) bugs and many improvements - this is not just an end user product.Its a ongoing production tool. If you can provide the technical reference for filetypes or features - within reason these can perhaps be added.

We use Pmode by Thomas Pytel (aka TRAN - thanks TRAN) which has been converted to our hybrid format for ease of use and modification, as our dos extender together with a pretty extensive pmode Dos call library. This will be supplied too.

I think that a fair few people would be interested in it, he does not. Hence the DOCs are not finished because he can't be bothered, he does however have a working evaluation copy running (limited source capacity). Okay okay so its crippled, but given the measly amout he wants for registration I think this is fair.

Penciled in is a provisional registration fee of only £10 (UK pounds about $17.50 US) or £25 including the full source code. Thisis only provisional - but no way is it not going to cost you $40 or more like some s/w apps.

Maybe some mail will arouse his interest again so:-

IF YOU HAVE ANY INTEREST IN CROSSFIRE - MAIL ME @

dave@flavious.prestel.co.uk

I am not a GEM programmer so I am asking this question, partly out of
ignorance and partly out of frustration.

Why do programs which work fine i 16 color mode have problems or refuse
to run in 256 color mode on a Falcon? Examples, Outline Art 3 runs

but can't display the graphics. SARA runs but refuse to display
images. WICOPAGE (an icon displayer) says "sorry I can run in 256
colors". Why does a program have a hard time when it has _more_
colors than it needs? Why not just use the 16 colors it wants to
use and just ignore the rest? What am I missing?

This is a large posting in a german news group. I won't confuse all readers
of c.s.a.programmer with a german text. If your newsreader is able to search
for a message-ID, the infos above should be enough.
If your newsreader is unable to catch the posting (maybe its already deleted)
you can use DejaNews:

   http://www.dejanews.com

Please enter "Rainer Wiesenfeller Auswertung TOS" (without quotation marks)
as search string.

Remark: All hardware listed in the opinion poll must be used with atari
TOS compatible software. Each 'X' stands for one of the 85 votes.

Let's have a look: ... a TT... ...a falcon... ...will set the machines...
that's one machine, another one, both machines ^

OK. I know what you like to say. And you see why I missunderstood you?

BUT: Why don't you use the higher power of these machines to make more
redraws or so? Why do you want to kick them back to 8 MHz?

>(definately true for Magic 2 - it returned 1.62 on an STE when tested.)

Hhmm. In which way do you request the OS version?
Looking at $FC0000 or $E00000? Why don't you use _sysbase at $4F2?
If I boot up MagiC 2 on TOS 1.04 and look at $FC0002 I get $0104,
if I look to the OSHEADER structure pointed in _sysbase, I get $0200,
date 10.08.1993. That's the same like it shows you the GENERAL.CPX.
This method (using _sysbase) does also work with image files.

(If you need a source code, I will post it, it's 2 KByte C code including
comments...)

>This makes it impossible to have values for both Magic and TOS in

What certain frequently used routines and addresses are used by STOS?
Why not divert them to a documented way to access the OS? (I mean the
trap routines of definatly all atari TOS versions.)

"Using the OS version number to determine the location of undocumented
variables is not acceptable. You have been warned."
(Pexec-Cookbook, Atari Corporation, 19.03.1991)

Greetings,
  Uwe.

In article <678_9701041141@conchbbs.com>
John.Kormylo@7861.conchbbs.com (John Kormylo) said:-

```
>g > p = strtok(s,"|");
>g > while (p) p = strtok(NULL,"|");
>
>I'm not sure what strtok(NULL,"|") is supposed to do (other than
>cause a two bomb error).  This usage is certainly not in my ANSI C
>reference.
```

```
char*    strtok(char* s1, char* s2)
```

strtok has an internal static pointer which it uses to keep track of the remainder of s1. When you pass s1 as non NULL it initialises this pointer. Subsequent calls with s1=NULL cause it to use the internal pointer. That was a (general) summary of my docs. Another thing my strtok does, is scribble nul chars over the string. Any mention of this in ansi? I guess the only other possible mechanism would be this? ...

```
p = strtok(s,"|");
while (p) p = strtok(p,"|");
```

>However, it works fine with Pure C, stopping at the right spot.

Wierd! My strtok is from Mark Williams C which is mostly K&R but was moving toward ansi as best it could, considering the standard was not finalised.

I'm beginning to suspect the mechanism has changed and that I have the old mechanism. In addition, it appears to be buggy as well!

x-admin: news@aol.com

Here is your assignment: Using format specifiers write a program, that states your name, age, and weight, on three lines. Use only one printf() call.

To help you out here is a template for your program.

```
/* NAMEOFPROGRAM.C */
/* THIS PROGRAM DOES SOMETHING */

#include <stdio.h>  /* You must use this preprocessor directive, because
it contains the printf() function */

main() {   /* the starting bracket tells the compiler where the main
function begins */

LOGIC GOES HERE

          getchar();   /* This waits for a return, so you have time to
read the output before the program ends */

}   /* Don't forget the ending bracket, the compiler needs to know where
the main function ends too!  */
```

Have you all been running into compiler errors? I'm sure you have! I have! Forgetting a quote or a semi-colon gives the compiler fits doesn't

it? C is a very exacting language when it comes to syntax, but that is in part why it produces such great code!

oh yes, one other thing, the compiler strips out spaces, all the indentations are for readability and are traditional, they are not absolutely necessary.

For those of you following the C Tutorial, Lesson 4 will be posted on Saturday, January the 4th.

I originally said every two weeks, but I'm afraid everyone would get bored if I waited that long, by necessity these lessons must be short (AOL won't let me post long articles)...

thanks,

Robert

> Looking forward to this tutorial myself, but buggered if I can get
>hold of a C compiler ???

FYI: There are also C compilers available free of charge.

- Sozobon C
- GNU C/C++

Both are not for beginners, (no IDE) and demand a lot of RAM and disk space.
At least 4 MB RAM and about 5..20 MB empty disk space.

Chatwin from Dirk Haun is a shareware development environment for nearly all
programming languages.

You can find the related files on several ftp servers:

```
sunsite.cnam.fr/pub/Atari/Programming/soz*.zoo  Sozobon C V. 2.0
ftp.uni-kl.de/pub/atari/languages/gcc/*         GNU C 2.6.3
                                                (version 2.6.3 is old but more
                                                 stable than 2.7.x)
```

There was a HiSoft C interpreter on coverdisk of ST Format 71.

This one is good for doing the very first steps in C, no large configuration
files and so on, it fits on 2 disks.

Disadvantages: No executable output, IDE not very compatible for newer
ataris.

>people have made coming into this thread, they have gone away with
>there tail between there legs :))

As you know, I tested your recently made games, they are good for atari

machines designed in 1983, not for the newer, designed in 1988...
^ first ST ^ first TT

Ohh! I'm very interested in that nice piece of software that can turn a
TT to 8 MHz, because it's impossible to do that without soldering and
redesigning 3 chips! (Reference: Atari TT 030 Hardware Reference Manual,
Atari Corporation, June 1990)

FYI: There are 3 official TT TOS versions: 3.01, 3.05, 3.06.
And some (>4) patched versions...

That sounds that you can't fix the STOS compiler to produce working code
for newer TOS versions. (I know from earlier postings that you own
MagiC for your ST and Gemulator and a MagiC PC demo.)

In <32c70945.13509507@news.airtime.co.uk> Tony Greenwood wrote:

That sounds that you can fix the STOS compiler to produce working code
for newer TOS versions.

Now here's the question: Can you or can't you fix it?

Are there 2 Tonys?
The first is saying "Yes, yes, it can be done!"
The second: "No, I've never said that!"

A much more important point: _WHY_ must you patch the STOS compiler?
Is this a very good build-in feature of the so called best game programming
language?!? This feature is so unique, I've never seen it in other actual
programming languages of the old year 1996. ;)

At this point: A happy new year to all.

 Yes I agree, from utter crap

>is usefull for writing games, but you are still stuck on the GEM idea of the

 Aw come on...you can't even admit that it is good for making games,
you are stretching the imagination here, alright you beleive C is
better, but you MUST accept that STOS does a good job of making games?
how can you not admit that?

>eighties. Please set your gemulator to normal resolution (640x480 and at least
>16 colors) get a mordern (German) GEM game and be stunned.

 gemulator ??? I only have the demo installed, and that only goes as
high as st high mono and no sound?

> >> Will my game work on a not yet released TOS version? No.

> > YES!....Give us a new TOS version and it will be fixed for it just
> > like all the rest have ?

>So, the answer is no. The TT and the STe are about the same age. It took STOS
>support over five years to fix it for a TT. Did you cover all TOS versions?

 haha it took a while to get a fixer, now the fixer is here, it just
needs upgrading to tos versions, the problem as you well know , was
that no TT owner came forward with the information needed to fix for

there machines ?

>There are at least 2! Are there important differences between the German, French
>and UK versions of the TT TOS? Who can tell?

 Yes who?....so you cannot argue for or against can you ?

> > I do not recall ever saying STOS was faster than C, I would never say
> > such a thing, I have stated STOS is the better choice for making
> > games, not that it is faster?,
>
>What about that quotation from Uwe Haase. ('C can't handle anything that needs
>speed, timing and power' or something like that, the message has already been
>whased away be new messages.)

 yeagh well like i say, you TALK a good debate and get me into
corners, :).....missquoting or quoting parts is a good way to win an
argument, count the number of times i illiterated that C is faster,
not the one time I said it wasnt...sheesh!

> > able to work on a TT, it will also work on a falcon without the use

>
>Forget the point about 8 MHz. (You can't set a Falcon to 8 mhz (to say in words
>8 milli Hertz).) If your game is supposed to work in 1 vbl then simply wait

 You can't?....ho I didn't know that?...mute point then ?

> > STOS can do a lot more than make games.....

>Ofcourse, I think that you, as a experienced STOS programmer, can do almost
>anything with at as long as it doesn't need GEM or compatibility with 'super
>computers'.

 compatability with super computers is a moot point....we been there

 GEM is also a little mute, I don't want to use GEM

 and how many C coders could have made that version of heartland you
did?, not many, if they could, then how come no one does?, they cant
all be making poxy gem applications that have already been made ten
time over?

>I think less suitable is a better discription.

 Hmmmm maybe :)

> >> together in a library for next time use?

> > AND ? so what...I have made a few platformers, didnt need C libraries
> > ?

>I think that you have to experience advantages like that to appreciate them,
>they are not highly necesarry, but make the live of the programmer easy.

 But I have a couple of disks full of much used routines that I can
merge into my program listing whenever I need them, alright this has
to be done when coding rather than when compiling, but much the same
idea?

BTW I now have GST C and am taking the C tutorial in c.s.a.p, this is
after learning a little about C from this thread, and after seeing
your heartland demo, that swung the decision to learn C,
I was honestly amazed <smile>

Cheers.....!ynoT

I thought that company went out of business more than five years ago.

Sozobon C (various versions) is freely available on the Internet and can be
used on a 1 Mbyte machine with floppies IIRC.
The very best Atari compiler (not counting compile speed or IDE), GCC, is
also free, but you need 4 Mbyte and a harddrive to use that. G++ is the C++
version of the same compiler (only C++ available for the Atari).

Well, C++ was based on C. I think the ANSI-C standard did indeed take a few
features from the newer language, though.

>understand C++. Some people learning C++ learn C at the same time,

Unless you do very strange things, chances are good that your C program is
also a C++ program without you even knowing it. ;-)

You can well do without the things in C that are different in C++.
(I just tried to remember a difference, but I couldn't...)

>however it is wise to learn C first, and thoroughly before moving on to

Many people would disagree with that. I'm one of them.

You can easily use C++ as a 'better C' and not bother with the object
oriented things. The compiler will protect you from more stupid errors and
you can take advantage of many nice features.

Learning object oriented programming from the start is probably also a very
good idea.

>--Should I learn C or BASIC first?
>
>The fundamentals of programming, i.e. accepting input, manipulating data,
>formatting output, are universal regardless of which language you choose

I guess this isn't the place to go into imperative vs logic vs functional
(vs whatever) programming. ;-)

>will find useful in other environments. There are versions of BASIC
>available free for the Atari computer, whereas C usually costs money. It

Hmm, apart from one or two BASIC versions that were released on magazine
disks, I've not heard of a free one.
On the other hand, there are several free C compilers.

>may be wise to start programming in BASIC to see how well you like
>programming, although C compilers are pretty inexpensive nowadays. C has

I'd rather say the main reason for using a traditional (interpreted) BASIC
is that you can more easily test (not too complex) things out. It's very
easy to crash the computer using C and you always have to wait for recompiles.

That sounds reasonable.

Your main() function is probably no more than 50 bytes or so, but the
printf() library function can be quite large. Your executable also includes
a bunch of stuff used by the initialization code that's run before the call
to main().

>Using GST C...Anyone have any opinions on this C ???? please?

I wonder how many even remembers it. ;-)

The code quality of such an early compiler is not likely to be very good
and it probably doesn't handle function prototypes or other ANSI-C stuff.
It's quite possible that it will be OK for this course, though.

Will the course be using ANSI-C, by the way?
If not, I hope there will at least be function prototypes.
(Does Laser C have that?)

I dunno if it's the call itself or just my compiler binding but I've
found most of the rsrc_gaddr() options do not work correctly. Thus,
all I tend to use is R_TREE and some macros. If you do it the same way
then ...

```
#define TePtext(ob,x)           ((TEDINFO*)ob[x].ob_spec)->te_ptext

OBJECT   *ob;
char *p;

rsrc_gaddr(R_TREE,tree_idx,&ob);
p = TePtext(ob,obi);
```

>
>Thanks for the C code for this but unfortunately (as I stated in the
>original posting) I'm using assembler and I do not know enough C to
>work out what is happening in the above.

Once you've got the tree address , index into the OBJECT array ...

p = tree + (itemnum * sizeof(OBJECT));
                      ^^^^^^^^^^^^^
                      24 bytes iirc

Now add the ob_spec offset ...

p = p + 12

and fetch the TEDINFO structure address ...

p = *p   /* ie something like move.l (a0),a0 */

Now you can access any of the TEDINFO members by adding the desired
offset. The te_ptext offset is zero so a move.l (a0),d0 will leave you
with the address of its nul terminated string in d0.

As my assember knowledge is pretty vague here's another example in
case I've screwed up the above ...

Fetch TEDINFO address for object item 5 say, p = ob[5].ob_spec ...

p = ob + (5 * 24) + 12
move.l   (p),te_ptext

[Posted on 2 Jan 1997 08:22:37 GMT]

I'm looking for a patch program that will retro fit my 520ST with the system cookie jar so I can run STiC and AtarIRC etc. where can I find such a program? Any help is great as I am a PC man (yes, yes, I know, kill me later) and don't know much about the world of Atari. Thanks much!

>
> I'm finding out the address of the te_ptext by using rsrc_gaddr()
>
> Is the address returned by doing this the actual address of the text
> or does the returned address just hold the address of the text?

It depends. With rsrc_gaddr you find the address of a specified structure, but you need it's index in the corresponding array. For TEDINFO you'll rarely have it. I normally use the following sequence of lines to get the address of the te_ptext :

```
   OBJECT   *tree;
   TEDINFO  *ted;
   char     *ptext_ptr;

   rsrc_gaddr (R_TREE, MY_TREE, & tree);
   ted = tree[MY_TED].ob_spec.tedinfo;     /* this is Pure C */
/* ted = (TEDINFO *) tree[MY_TED].ob_spec;    should almost always work */
   ptext_ptr = ted->te_ptext;
```

The first line gives you the address of the root object of the object tree, the name of which is assumed here MY_TREE, and which is specified inside your resource construction set. From that address, using the index of your TEDINFO object MY_TED, again set in the resource construction set, the address of the TEDINFO structure is gained. Note that this notation depends on how your compiler defines the OBJECT structure. You may need to use the notation commented out. Using the address of the TEDINFO you immediately have the te_ptext, as well as any other component of the TEDINFO, like te_pvalid, te_ptmplt, etc.

The root object of any CPX must be 256 x 176 pixels. I believe the COPS (an Xcontrol replacement) does not require a CPX to be this size. But I highly recommend to not differ from this size, so that other people without COPS can use it too.

Sounds right. The reason is that printf() is a super duper function that is able to do virtually everything in terms of text output. It thus takes some space. There are smaller, more specialized functions, I'm sure they will be covered in later lessons.

> Using GST C...Anyone have any opinions on this C ???? please?

It's a rather old, not all too efficient c-compiler. But this holds for the lessons reference compiler Laser C too. It should certainly do everything required for this series of lessons. But it also means that you should not despair if you can't get a sample program to work, you might have come across a compiler bug. This happened to me, I learned programming C using Megamax C and a few times I was close to despair. But with growing experience you learn how to destinguish compiler bugs from your own ones.

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN and STonX.
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and

movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Almost anything you do, however small, will cause library(s) to be linked
into the program. There is a "zero-code" overhead!

Relax! The library(s) are only linked once - you can go on to write megabytes
of your own code with no further overhead.

Roger

>[...]
>
>That sounds that you can't fix the STOS compiler to produce working code
>for newer TOS versions. (I know from earlier postings that you own
>MagiC for your ST and Gemulator and a MagiC PC demo.)

 Nope.....you are spending far too much time looking through back
posts, your are soooo confused,

 I own the Gemulator DEMO
 I do not own and have never owned the MagiC PC demo
 I have MagiC but not for my ATARI (MagiC on floppy system????)
 I tried MagiC on the Gemulator Demo
 I now use Gemulator DEMO and tos image

 From postings in c.s.a.st it would seem the Gemulator demo and full
product act considerably different, for example the full version wont
accept a tos image?

 If you are going to constantly quote old posting then do try and take
notes of some sort.....

>> YES!....Give us a new TOS version and it will be fixed for it just
>>like all the rest have ?
>[...]

>That sounds that you can fix the STOS compiler to produce working code
>for newer TOS versions.

 Not by me, I can only program in BASIC, I do not make the fixers, but
simply quote what the fixers authors claim?

>Now here's the question: Can you or can't you fix it?

 I cannot, the authors of the fixers say that if a user of any tos
version will spend 5 minutes helping them then they can fix for any
tos, including madusa and hades....chew on that!!!!!

>Are there 2 Tonys?

 Childish of you....

>The first is saying "Yes, yes, it can be done!"

 The first is actualy saying as far as he knows it can be done,

>The second: "No, I've never said that!"

 bollox, you made that up?

>A much more important point: _WHY_ must you patch the STOS compiler?

 ho no....yawn yawn yawn.....why must you ask, do we realy need to go
through all this...yawn yawn yawn

>Is this a very good build-in feature of the so called best game programming
>language?!? This feature is so unique, I've never seen it in other actual

 WAIT...you are wrong again, who called it the best games programming
language? I certainly never called STOS the best games programming
language,
 Ho dear...so confused that you came to the wrong thread?

>At this point: A happy new year to all.

 and a Happy new year from me,

 BTW for the confused amongst us, and especialy people like Uwe who
does not even understand the thread he is trying to contribute
to..although contribute is a loose term when he writes so much
untruths?

The thread was..STOS is the best BASIC for making games in 1996, then
I added that I would include C and say that STOS would even beat that,

2 POINTS FOR EVERYONE TO NOTE

1) I have since seen a demo of HEARTLAND by Hans and it looks like it
will eventually be better

2) It is now 1997....the thread is mute....

Cheers.....!ynoT

Look!....in the above that YOU quote, it quite clearly states that my
original comments where my belief, but after seeing what Hans has to
say I have since changed that beleif, that is what the above says, if
you do not understand then you should not make such statements, I
conceded that given the information Hans has provided that I would

then be wrong, so just what exactly are you going on about ????

>>attitude, they think STOS=CRAP, they ignore wihout even testing
>>software simply because they know it is STOS,

>Most of them will still ignore STOS.

 yes my point exactly, because they have a pre conceived idea of what
STOS can produce, I am trying to change those views, I beleive I have
managed this to a certain extent with many people,
 A lot of people now do not automaticaly label STOS as "slow",
"unresponsive", "jerky" and "only good for small crap games", those
statements can NOT now be levelled at STOS,

 Ho don't be so childish, MORE people own ATARI machines you call old,
ie: STFM STe models than own TT, a LOT more, My software also works on
the Falcon...but you like to ignore that, you prefer to keep going on
about the TT, I say it will be supported in my next release,

 Stop being so picky!

                    Cheers.............!ynoT

Thanks for the info. That's 32 x 11 chars using an 8x16 system font.

> > I looked in the Compendium, but it appears to mention nothing on this

I looked at my copy of the Compendium (April 1994 edition), and it doesn't
appear to mention (in Chapter 10 [dedicated to XCONTROL]) pixel size of
the root object - only about the callbacks XCONTROL makes (cpx_init,
cpx_call etc) and the utility funcs XCONTROL makes available to a CPX.

I think it's wise to put at least one week between the lessons. That gives us time to respond on the lessons and discuss problems found. It also gives the lossons time to reach all of the readers. Bigger messages sometimes need serveral days to reach everybody. No one will get bored, I think but byt going to fast you will loose those who can't spend every evening behind the computer.

I sometimes see repleys to questions that arrive two or three days later. At this moment the lessons get lost in posts, reposts and forwards and that's a pity. The lessons are a great initiative, don't spoil it by rushing it.

> games? how can you not admit that?

It does a nice job for making games, but its core is still rotten. It works just fine on a 8 MHz ST, accelerated ST and the Falcon are a may be, all else simply won't work. This realy can't get the qualification good from me. Let us stick to ST arcade games:
Assembley is best
C is good
STOS comes right here
Put here all other basics

>> So, the answer is no. The TT and the STe are about the same age. It
>> took STOS support over five years to fix it for a TT. Did you cover

>
> haha it took a while to get a fixer, now the fixer is here, it just
> needs upgrading to tos versions, the problem as you well know , was
> that no TT owner came forward with the information needed to fix for
> there machines ?

It JUST needs upgrading to TOS versions? I am sorry, but I think this is not a small disadvantage of a programming language. For most programmers it's unacceptable. They will call any language needing this kind of fixing utter crap.

>> There are at least 2! Are there important differences between the
>> German,
> French
>> and UK versions of the TT TOS? Who can tell?
>
> Yes who?....so you cannot argue for or against can you ?

It simply means you can never tell STOS will work on a certain machine because you can not no if the TOS version used in that machine is known by STOS. You can never say: STOS will work on an ST compatible computer. It always has to be something like:
This game will work on TOS 1.0 (UK) 1.02 (UK and German), 1.04, 1.06, 2.06....

A game written in most other languages only need ST, Ste, Falcon or TT hardware to work. TOS version is not important.

>> Forget the point about 8 MHz. (You can't set a Falcon to 8 mhz (to say
>> in words 8 milli Hertz).) If your game is supposed to work in 1 vbl
>> then simply wait
>
> You can't?....ho I didn't know that?...mute point then ?

You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9 between those ratings.

> and how many C coders could have made that version of heartland you
> did?, not many, if they could, then how come no one does?, they cant
> all be making poxy gem applications that have already been made ten
> time over?

I really don't know. I expect all members of the TOS-crew could have done the same thing. Of the TOS crew 3 out of five members switched to other systems. One of them has written a MUD in C.

In general I think most of the C coders are doing more interesting things then writing games, just like I have been doing for the past years. Secondly a good game concept and graphics are as important as a good programming language to write the game in. That's why STOS still exists. It allows people with good game ideas or good game graphics and not enhough programmings skill to write a game themselves to write a game never the less.

A C simply makes an other type of program when there is no one to inspire him with good ideas and graphics. There are lots of good assembley coders out there too, but it needs more than a good coder to write a game.

>> I think that you have to experience advantages like that to appreciate
>> them, they are not highly necesarry, but make the live of the

Yes, the same idea, a bit clumsy though, but it works.

> BTW I now have GST C and am taking the C tutorial in c.s.a.p, this is
> after learning a little about C from this thread, and after seeing
> your heartland demo, that swung the decision to learn C,
> I was honestly amazed <smile>

Be warned, you need more then some knowledge about C to do a game like I did.
You also have to know how the graphics system of the Atari works.

I now a bit of the answer: STOS is using fixed ROM adresses to do some things. I don't know why it needs those adresses but every STOS program hase a table of ROM adresses that's used to get some fital information. So STOS has a build in incompatibility to every not yet released or unknown TOS version. I think the author of the gerneral STOS fixer can explain us which adresses are exactly needed and why.

> consuming:(

One of the advantages of C is that you can do almost anything in it, but it's also one of its disadvantages. You can do very stupid things and the compiler won't warn you that what you are doing is stupid. It just compiles it and the program will tell you you were stupid by crashing in a horrible way. :-) ? :-(

A good example is writing over array boudaries. Most pascal programs will stop with an error telling you tried to acces an array alement that doesn't exist. C will let you do it, allowing you to alter data that isn't part of the array you think you are accessing. Normally this causes the program to crash on very strange points or do very strange things. This is an well known hard to find bug in a C program. The most common error of this type is the off by one error: you are accessing one element too much.

But don't ley me spoil all those nice things to be discovered for you. You will meet this kind of problems soon enhough. ;-)

Bye, Hans Wessels

I am looking for a DOS utility to convert GFA BASIC source files to an
ASCII text-file. Can anyone help me?

Thank you.

Greetings from

> > better, but you MUST accept that STOS does a good job of making
> > games? how can you not admit that?

>It does a nice job for making games, but its core is still rotten. It works

 hehehe you just cant say it wihout adding something can you :)

>just fine on a 8 MHz ST, accelerated ST and the Falcon are a may be, all else
>simply won't work. This realy can't get the qualification good from me. Let us

 what else is there?...ho yeagh, madusa and hades..hmmmm

>stick to ST arcade games:
>Assembley is best
>C is good
>STOS comes right here
>Put here all other basics

 Well after seeing what YOU accomplished with C then I would now agree
with the above, this of course means Uwe will instantly quote me
saying I said different last week :(
 But the above now looks about right to me,

 However :)....a couple of months ago and you would have put STOS at
the bottom of the list, yes? ?

> > that no TT owner came forward with the information needed to fix for
> > there machines ?
>
>It JUST needs upgrading to TOS versions? I am sorry, but I think this is not a
>small disadvantage of a programming language. For most programmers it's

 It is absoloutly no dissadvantage to me, and I am programming ?, the
compiler fixes the programs when compiling, so I wouldn't even notice
now?

> > Yes who?....so you cannot argue for or against can you ?

>It simply means you can never tell STOS will work on a certain machine because

 But surely thats true of any language, you can never be sure, lok at
magiC, Not doing very well even on a Falcon....it's not just STOS that
this kind of comment can be aimed at..

>never say: STOS will work on an ST compatible computer. It always has to be
>something like:
>This game will work on TOS 1.0 (UK) 1.02 (UK and German), 1.04, 1.06, 2.06....

 I see that as reasonable, a far better solution than saying it works
on everything...then it doesn't ?

>A game written in most other languages only need ST, Ste, Falcon or TT hardware
>to work. TOS version is not important.

 True, in MOST other languages, not all ?

> >> in words 8 milli Hertz).) If your game is supposed to work in 1 vbl
> >> then simply wait

> > You can't?....ho I didn't know that?...mute point then ?

>You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9 between
>those ratings.

 So what was the point of the above?, trying to confuse me?

> > and how many C coders could have made that version of heartland you
> > did?, not many, if they could, then how come no one does?, they cant
> > all be making poxy gem applications that have already been made ten
> > time over?
>
>I really don't know. I expect all members of the TOS-crew could have done the
>same thing. Of the TOS crew 3 out of five members switched to other systems. One
>of them has written a MUD in C.

 So your average C user could not have made your version of
heartland?, that tells us a lot doesn't it?, we are then back to given
the choice, then STOS would be the language to choose, I have a
feeling a program like that would scare the hell out of MOST c
programers:)

>In general I think most of the C coders are doing more interesting things then
>writing games, just like I have been doing for the past years. Secondly a good

 that is a very biased opinion, more interesting?, who defines what is
interesting?, you may think making an archiver that will never become
standard is interesting, I say making a game that people enjoy is more
interesting?, seeing graphics come to life is far more interesting
than getting something to pack down one more byte :)

>write the game in. That's why STOS still exists. It allows people with good game
>ideas or good game graphics and not enhough programmings skill to write a game
>themselves to write a game never the less.

 Ho back to insults now, so I do not have enough programming skills to
write a game....tsk:(
 the above is stupid, anyone playing a good game written in stos will
not think the programmer has no skill, good grief man! what the hell
are you talking about ?

>A C simply makes an other type of program when there is no one to inspire him
>with good ideas and graphics. There are lots of good assembley coders out there
>too, but it needs more than a good coder to write a game.

 Really? a minute ago all you needed was STOS and an idea?

> >> I think that you have to experience advantages like that to appreciate

> > But I have a couple of disks full of much used routines that I can

>Yes, the same idea, a bit clumsy though, but it works.

 I take it that was you way of saying I am right.....hehehe

> > BTW I now have GST C and am taking the C tutorial in c.s.a.p, this is
> > after learning a little about C from this thread, and after seeing
> > your heartland demo, that swung the decision to learn C,
> > I was honestly amazed <smile>
>
>Be warned, you need more then some knowledge about C to do a game like I did.
>You also have to know how the graphics system of the Atari works.

 ho and of course STOS programmers don't know anything about the ATARI
graphics system do they, hmmmm making cups of tea and the odd game,
nothing too taxing for us STOS users hey?....tsk tsk tsk

Cheers.....!ynoT

Thanks to everyone who has helped me on this. I have now managed to
read the text from the te_ptext.

One point however.

Someone mentioned that putting '@' at the start of the field resets
the cursor to the start of the field.

I have found that this works fine under normal TOS but under Magic (on
my falcon and Magic PC for that matter) it doesn't seem to work.

The solution to this appears to be to put a null at the start of the
field instead of @. Is there any reason why I shouldn't do this?

> Only Kiddin.....Get back to your Knitting hahahahaha

How 'bout a new newsgroup "comp.sys.atari.knitting" then? :)

But seriously, there is a sort of knitting program for the TT called
"Stitchitiser" (sp?). It is used to design emblems/logos for clothing and
then "prints" them to a machine which sews them onto fabric. The package
lets you use multiple colours, stitch widths, etc.

When the package was demonstrated to the local user group here a few
years back, we were told it was $30000 (Australian) for the software, TT
and the other hardware (which I would say is the bulk of the cost).

Just thought it would be interesting for all the knitters out there :)

Either the GST linker isn't very smart or extensive debug info is linked with
the program. Pure C needs for the same job 21kb with debug info and 12kb without
debug info.

Dave,

> Can anyone help me with this or point me to somewhere that I can get
> more info on the structure of TEDINFO? (on line preferable as I can't
> really afford to buy any books on the subject)

Ok the start of the TEDINFO structure is pointed to by the OBJECT.ob_spec field of the object structure, the text of the actual object (the edited) text is pointed to by the TEDINFO.te_ptext field.

Below is a macro I wrote many moons ago to calculate the start address of the TEDINFO structure of an object. Field \1 contains the address the resource tree and field \2 contains the address of the object. a5 will then contain the address of the TEDINFO structure.

Because TEDINFO.te_ptext field is at the top of the structure to read the text all you have to do is - move.l (a5),a5 - and then copy from the address stored in a5. Example shown below.

To find other information fron the TEDINFO structure reference the the table shown below.

```
;----
;tedinfo_str macro
;Calculates address of tedinfo structure!
;----
tedinfo_str macro
    move.l  \1,a5
    add.l   #(\2*24)+12,a5
    move.l  (a5),a5
    endm
```

```
get_text:
        tedinfo_str dial_addr,obj

        move.l  (a5),a5
        lea     string,a4

loop
        tst.b   (a5)                * tst for null
        beq     .done
        move.b  (a5)+,(a4)+
        bra     .loop
done
        move.b  #0,(a4)             * add null

; a similar method maybe used to write text to the dialogue field.

TEDINFO:
te_ptext:   ds.l    1   ; Pointer to text
te_ptmplt:  ds.l    1   ; Pointer to template
te_pvalid:  ds.l    1   ; Pointer to string containing valid chars.
te_font:    ds.w    1   ; Font used, 3=sys font, 5=small font.
te_junk1:   ds.w    1   ; reserved
te_just:    ds.w    1   ; text justification, 0=left,1=right,2=centre
te_color:   ds.w    1   ; object colour and pattern
te_junk2:   ds.w    1   ; reserved
te_thick:   ds.w    1   ; border thickness
te_txtlen:  ds.w    1   ; length of te_ptext (inc. NULL)
te_tmplen:  ds.w    1   ; length of te_ptmplt (inc. NULL)
```

Hope you find this information useful.

Jr,

What do you use to develp programs uner MagiC and then debug within the multitasking environment ? Ok, you can compile C programs with Lattice or Pure C as a task, but the debugging procedure is much more tricky.... can it still be done, or is it necessary to switch to monotask ?

Ermm .. probably :)

There are some linkers which will optimise the object program so that only CALLED items are linked.

I have a Modula 2 system which does this - not sure which C linkers do simi

Possibly GST is linking in the floating point printf() stuff as well?

>debug info.

MWC omits the floating point parts by default, saving quite a bit of space. Can PureC do something similar?

I assume you are talking about converting a tokenized GFA BASIC program into an ASCII text listing of the program? (A GFA BASIC .LST file is already standard ASCII text)

As far as I know, the only way to do this is with a copy of GFA BASIC. Just load the GFA BASIC program, and then Save As ASCII (may be called WRITE? I can't remember what its called right now).

We have the following CD-R media for sale.

Brand: Pioneer
Type: Printable Media (Surface is blank for printing or labels)
Size: 74 min (650 mb)
Price: 6.99
Minimum Order: 10

Brand: Pioneer
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Maxell
Type: Gold on Gold
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: TDK
Type: Gold on Gold
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Hewlett Packard
Type Gold on Gold
Size: 74 min (650 mb)
Price: 7.15
Minimum Order: 10
Lifetime Warranty

The Copy Cat Shop has all your CD duplication, replication, recorders, software, and media needs.

If you have any questions or comments feel free to call.

Cordially,

s > ho?....so the whole library is used when you only need part of
s > it?,

That depends on the linker.

The main problem is that printf() can format strings, chars, ints, longs, and floats, and calls a bunch of other functions to handle all of these cases. It also uses stream I/O, which requires a considerable number of functions to handle its buffering and error handling peculiarities. It also needs to parse the format string.

You could save considerable amounts of RAM calling functions like Cconws(), strcat() and ltoa() and doing all of the formatting yourself, but that is hardly to goal of a tutorial.

Yep, as soon as you link the floating point library the floating point printf is linked too. But I am not very familiar with this part of Pure C, I almost never use it.

Dear Tony, Magic is exactly the kind of program that has to eat all the shit the hardware brings, that is because it is an operating system. All programs running under the OS don't have to worry about the particular hardware because the OS does.

STOS is an programming language, just as C, Pascal, Modula 2 and the other basics. A programming language can use the OS to acomplish certain tasks. The programmer can decide not to use the OS and go directly to the hardware for the sake of speed, knowing he has to pay the price of incompatibility.

The problem with STOS is that the programming language itself doesn't use the OS the right way, forcing you ino a lot of problems. It's like a paint program expecting the screen memory to start at $78000 (that's rthe start of screen memory in a half Mb Atari ST), needing fixing for all other memory configurations. (There was actually a game that had this problem, it was Hacker.)

>> never say: STOS will work on an ST compatible computer. It always has

>
> I see that as reasonable, a far better solution than saying it works
> on everything...then it doesn't ?

I can say that my compression program works on all Atari compatible computers. And if there are trouble it is my own mistake, I did something wrong then, not the programming language I use.

The samething can be said about Heartland 2.0, it will work on all Atari compatible computers with ST compatible videohardware, a soundchip and a MFP. Because I know I am directly accessing that hardware and I am depending on some properties of that hardware.

>> A game written in most other languages only need ST, Ste, Falcon or TT
>> hardware to work. TOS version is not important.
>
> True, in MOST other languages, not all ?

I can't think of an other example like STOS, but I am not 100% sure there is none. Maybe there still are some obscure languages that won't work on a 68020 and higher because the stackframes are different and some instructions became privilidged. But depending on the TOS version like STOS does is (AFAIK) unique.

>> You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9
>> between those ratings.
>
> So what was the point of the above?, trying to confuse me?

Ok, let me unconfuse you.
1 ST, Mega ST and STe work on 8MHz.
2 There are accelerated ST's, switching back to 8MHz might be possible but the way to do that is accelerator card specific.
3 A Mega STe works on 16MHz, it can be switched bac to 8 MHz
4 A TT works on 32 MHz (there are a few pre production TT's working on 16 MHz), clockspeed can be switched back to 8 MHz
5 A Falcon works on 16MHz, it can be switched back to 8MHz
6 There are accelerated Falcons. I don't know what happens when you try to witch back to 8MHz on these Falcons.
7 Clones and emulated Atari's work on a variety of clockspeeds, no change of switching back.

Bottom line is: Don't rely on the hardware to be 8MHz for correct timing of your programs. Make sure your timing is independend of the clockspeed, how that can be done was shown in my previous mail. Feel free to ask if you have questions about the code, that's what a newsgroup like this is for, isn't it?

>> and how many C coders could have made that version of heartland you

>> all be making poxy gem applications that have already been made ten

>> time over?
>
> So your average C user could not have made your version of
> heartland?, that tells us a lot doesn't it?,

I realy can't tell, honest, not the slightest idea. I don't know what an average C user knows about the language he is using, I don't know how much he knows about the OS and don't know howmuch he knows about the hardware. I don't even know how much knowledge is needed to do something like that. I only do know one can write better games in C then in STOS.

For me it was quite easy. Most of the time was spend hacking your game to get the graphics and to convert them into the format I could use for my game.

> we are then back to
> given the choice, then STOS would be the language to choose, I have a
> feeling a program like that would scare the hell out of MOST c
> programers:)

The whole idea of coding a game would scare a lot of people. For a C programmer, knowing he has to use basic will be enhough to commit suicide. A C programmer won't go back to basic, unless he really has to, because there is no C available.

>> In general I think most of the C coders are doing more interesting
>> things then writing games, just like I have been doing for the past
>> years. Secondly a good
>
> that is a very biased opinion, more interesting?, who defines what is
> interesting?

Why are people programming?
1 Because is't their job.
2 Because they like it.
We can forget the first group of people, unless they belong also to the second group as well.

The people of group 2 will program because they like it. It doesn't matter what they program or why they do it. So the people who program for fun are the people who define what's interesting. You said you haven't seen many C games lately, let me give you some hypothesis explaining it:
1 you didn't look good enough.
2 there are far less C coders as STOS coders
3 most C coders are doing more intresting things then coding games

I am only quite sure that point isn't true.

> you may think making an archiver that will never become
> standard is interesting, I say making a game that people enjoy is
> more interesting?

Yes, you may say so. (BTW: my compression program is the only compression program still being supported on the Atari ST platform and the lastest version

does create LZH archives.)

> seeing graphics come to life is far more
> interesting than getting something to pack down one more byte :)

Not for me, the best days for me are when a new routine is working as it should, packing a few bytes better, or a few seconds faster. Writing the game engine was also nice, but designing new graphics and a new game map is not my idea of having fun.

>> write the game in. That's why STOS still exists. It allows people with
>> good
> game
>> ideas or good game graphics and not enhough programmings skill to
>> write a game themselves to write a game never the less.
>
> Ho back to insults now, so I do not have enough programming skills to
> write a game....tsk:(

Nope, you proved you could do it with STOS. But could you have done it whithout STOS? It is easy to get started in programming with STOS. That's what a basic is all about. To program a game in C requiers more programming skill, but the result can be better too!

> the above is stupid, anyone playing a good game written in stos will
> not think the programmer has no skill, good grief man! what the hell
> are you talking about ?

And all STOS programmers admire the programming skills of the writers of the language extensions, because they can't do things like that themselves? The players of those games don't bother about how much prohramming skill was needed to create the game. But as an programmer I can say you need probably less programmings skills to write a game in STOS then in C. STOS is easier, but at the same time I can say C can make the better games and is therefore the better language for writing games.

>> A C simply makes an other type of program when there is no one to
>> inspire him with good ideas and graphics. There are lots of good
>> assembley coders out there too, but it needs more than a good coder to
>> write a game.
>
> Really? a minute ago all you needed was STOS and an idea?

No, you are mixing up my words. With an idea you can write the game in STOS. If you read the above you will see the assembly coders have the programming language, but they are missing nice ideas or graphics.

> ho and of course STOS programmers don't know anything about the ATARI
> graphics system do they, hmmmm making cups of tea and the odd game,
> nothing too taxing for us STOS users hey?....tsk tsk tsk

Well, you showed me you knew nothing about the graphics hardware of the ST! With knowing about the graphics system of the ST I mean knowing about the

hardware registers on adres $ff8200 and up. When I was happily poking around in those hardware registers in an example program you told me you didn't understand, and that you were using STOS so there was no need to understand it.

p > They do.

I tested it and have to admit that TOS 3.06 doesn't check the
ownership before freeing RAM. Can you guarentee that this is true
for EVERY single-tasking TOS?

LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in order to allow your compiler to work. Other elements are by tradition or for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand everything about it at this time:

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */

#include <stdio.h>  /* This header file defines printf()  */

main() {
     int count;

     for (count=1; count<11; count++)

         printf("\ncount=%d", count);
         getchar();
     }
```

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */
```

A program starts with a comment that gives the filename and brief description of the program.
If you'll remember from lesson one, comments are simply remarks that are ignored by the compiler, but are useful reminders that aid other programmers in their understanding of your code. A remark begins (without the quotes) with a '/*' and must end with a '*/'

```
#include <stdio.h>  /* This header file defines printf()  */
```

The next portion of a C program is the preprocessor directives. These are #include and #define. The preprocessor directives are for the benefit of the C compiler. The #include <stdio.h> tells the compiler that you will be using the stdio.h header file. This header file contains information about the printf() function. Confusing? Don't worry I'm just trying to give you an outline of a C program, we will cover header files again.

```
main() {
```

Remember, C is a structured language. That means you reuse code. over and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a language made up almost entirely of functions. Every C program contains a main() function, and by tradition main() goes first. Our example only has one function, but in real life C programs have many.

```
     int count;
```

Initializes a variable 'count' and tells the compiler that it will be an integer.

```
     for (count=1; count<11; count++)
```

A for loop, don't worry about this just yet.

```
         printf("\ncount=%d", count);
```

printf() is not a keyword! printf() is a function that is being called. We do not have to rewrite this function because it has already been written. The printf() is in the header file stdio.h which we told the compiler to use at the beginning of the program.

```
         getchar();   /* waits for the enter key before exiting */
```

getchar() is another function that is part of the stdio.h file.

```
     }
```

Clear as mud now? Don't worry, I just wanted to familiarize you with the makeup of a C program.
To Summarize: Start with some comments so you can remember what the program is all about later, then you will do some preprocessor directives,

such as telling the compiler what header files you will be calling up in
your program (what prewritten routines you will be borrowing), then you
will write the function main() which contains the logic of your program.
Finally, you write any functions that
main() calls, but are not included in any header files(not necessary in
this tiny example, but done in real life)

Poor you, you have seen STOS being upgraded from utter crap to something that
is usefull for writing games, but you are still stuck on the GEM idea of the
eighties. Please set your gemulator to normal resolution (640x480 and at least
16 colors) get a mordern (German) GEM game and be stunned.

 >> Can I make a game for a so called super computer? (including TT's)
 >> No.
 >
 > I don't see this as much of a problem, I will be able to include TT
 > by the next game I release as that has been sorted already, theres

> only madusa and hades I cannot support..so what ?

No, you don't see it as a problem, but someone who wants to develop for those super computers does when he wants to use STOS (maybe because he heard in this newsgroup that it is supposed to be the best language for games?).

>> Will my game work on a not yet released TOS version? No.
>
> YES!....Give us a new TOS version and it will be fixed for it just
> like all the rest have ?

So, the answer is no. The TT and the STe are about the same age. It took STOS support over five years to fix it for a TT. Did you cover all TOS versions? There are at least 2! Are there important differences between the German, French and UK versions of the TT TOS? Who can tell?
The Phenix project is trying to make a free TOS version with sources freely available. It's impossible to fix STOS for every diferent compilation of such a TOS version.
The only solution is to fix STOS so it looses it's nasty habit to use fixed adresses.

> I do not recall ever saying STOS was faster than C, I would never say
> such a thing, I have stated STOS is the better choice for making
> games, not that it is faster?,

What about that quotation from Uwe Haase. ('C can't handle anything that needs speed, timing and power' or something like that, the message has already been whased away be new messages.)

>> It isn't working on the TT too. Useless? Please let the programmer
>> decide on

> able to work on a TT, it will also work on a falcon without the use
> of backwards, by having code inserted that will set the machines to
> 8mhz and atari st low :)

Forget the point about 8 MHz. (You can't set a Falcon to 8 mhz (to say in words 8 milli Hertz).) If your game is supposed to work in 1 vbl then simply wait forthe next vbl when you are done with prparing the next screen, no problem. But when it is supposed to work in 2 vbls like heartland, then make sure it always uses those 2 vbls, even on faster machines. You can keep track of the number of vbls by reading _vbclock, a system variable that counts the number of verical blanks sice system start. You can read it by lpeek($462). A routine waiting for the second vbl could look like this (it's not exactly STOS basic, not C, not Omikron basic but just a discription that should easily be ported to any programming language).

```
  if(lpeek($462) & 1) then   ' we are doing a bitwise and overhere
                             ' ie (13 & 7) = 5
    Vsync()                  ' wait for a vertical blank
  endif
```

```
  temp=workscreen
  workscreen=displayscreen
  display=screen=temp        ' swap workscreen and display screen

  Setscreen(workscreen, displayscreen, -1)
                             ' workscreen is now the logic screen
                             ' display screen the physic
  Vsync()                    ' wat for a vertical blank
```

This code will wait an extra vertical blank if there is an odd number of vertical blanks in the counter.

```
 >> Please explain me why... You don't have to use GEM, you CAN use GEM.
 >> The choise is to the programmer.
 >
 > There you are,  I didn't know that?, and the knitting class say this
 > thread is none informative :)
```

Ai, you could have known that, you have a program of mine that hasn't got any Gem init it, although it was written in C! (There a lots of people asking me for a Gem interface to that program.)

```
 >> How fast do you want to display your background sprites?
 >
 > NOT so fast that it spoils the game ?
```

High speed background drawing won't spoil the game, bad timing will.

```
 >> Yes it is, I was thinking about a lot of GEM stuff and so on, maybe
 >> even a compression program?
 >
 > Like my picture compactor currently used by ST+ diskzine and a couple
 > of personalized programs made on request, people like my picture
 > compactor because it is soooo fast :),
```

Wow, please tell me:
1 is compression fast or only decompression? (Decompression time is the only thing that matters though)
2 what compression algorithm are you using? (Run length encoding is my guess)
3 ratios, what is its ratio? (Let us use the intro picture from heartland as a example picture (in degas PI1 format).)
4 what is the size of the decompression program? (a picture compressor requiering a 2Mb decompression engine is of no use for ST games :-))

(BTW: my results are 7413 bytes for the 1kb decompression routine and 8245 bytes for the 144 byte decompression routine, speed: beats atomic, ice and sentry packer :-) Compression and decompression routines are available in C but for the sake of speed and size I recommend the assembley versions.)

```
 > Hans please stop insisting STOS cannot do certain things, I then have
 > to start listing them all, again and again, you must concede that
```

> STOS can do a lot more than make games.....

Ofcourse, I think that you, as a experienced STOS programmer, can do almost anything with at as long as it doesn't need GEM or compatibility with 'super computers'.

I think less suitable is a better discription.

>> eeerm again, so what? what is so good about that? it doesent seem to
>> do the C "games" programmer any good does it..
>>
>> Well, I designed some routines for heartland. I might put those
>> together in a library for next time use?
>
> AND ? so what...I have made a few platformers, didnt need C libraries
> ?

I think that you have to experience advantages like that to appreciate them, they are not highly necesarry, but make the live of the programmer easy.

When choosing a programming language becomes a matter of taste there is no discussion possible. We can only discuss advantages and disadvantages of certain programming languages. Saying the best for games does IMHO say nothing of someone just getting started in (game) programming, to me its about speed, speed and more speed (thinking about arcade games right now, we covered all other types of games).

> You seem pre-occupied with speed, I will say C is faster, there!
> Happy!, but still it would not be most peoples choice to make a game
> in if they have STOS to choose from, the advantages of using C do not
> compensate having to use C,

Yes, you have first to learn programming before you can switch to C. It's clearly a language for advanced programmers. It's an incredible powerfull language that will hapily carsh if you made a mistake.

> ie no one in there right minds is making
> games in C, but lots of people are making them in STOS.....

Yes, and the mayority is right aren't they? They are going for the easy way to make games, but the easy way isn't the best way. Again, the easy way to make games is to use the programming language you already know, no discussion possible.

>> I will, I told you I will, so I will, is it so hard to believe what I
>> am claiming? Or are you eager to get a better version of the game?

> better?

But heartland could get bigger without loosing information. And even with fulls creen games you can simpley overlay the status bar on the screen?

>> No, I am reading Jouystick cursor keys and you pad at the same time.
>> You can
>
> Well that is simply another way of doing it, I like the idea of a
> menu, giving the user a setup screen ?

No, I don't like those things, it then either use this or that, when no limitations are necesarry simple support them all without forcing the user to select the joystick of choise first.

> comments to follow.....

I will be waiting for them.

Now signing of for this year, although there are some more messages to be answered, they have to wait to 1997.

So to all readers of COMP.SYS.ATARI.PROGRAMER:

Happy newyear! May the Powers in the Clouds guide you safely on your quest through the lonely desert, haunted by Evil User Requests and fearsome Bugs.

So let me see if I've got this correct.

I'm finding out the address of the te_ptext by using rsrc_gaddr()

Is the address returned by doing this the actual address of the text
or does the returned address just hold the address of the text?

I picked up the announcement about these tutorials in comp.sys.atari.st, but
unfortunately I appear to have missed the introduction - could some kind
individual re-post or e-mail it to me.

TIA and a Happy New Year to all!

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!

----Robert Dupuy

(***p.s.***) I am brand new at this, and appreciate any help anyone may

wish to offer.

I use Gemulator with Magic 2...but I do Atari programming on my pc using
Laser C..

I've heard good things about Lattice 5.6 and will probably try that out
when I get the funds...

As for Laser C, it does work on the pc, but you must set Gemulator to
Atari Disk Mode...I am not sure why this should be a requirement, but it
will not work otherwise.

Good Luck, and have a happy new year.

I know not the people of which you speak, but as a business man myself,
I would suggest that the answer to your query lies in the question.

They charge what the market will bear, and in so doing maintain the
viability of their endeavour. Or to turn it the other way round, the
ones you like because they charge less disappear because in keeping
you happy they are themselves unviable in the long term.

Subject: Intro. to C tutorial, part 1
From: rdupuy5596@aol.com (RDupuy5596)
Date: 30 Dec 1996 17:47:14 GMT
Message-ID: <19961230174500.MAA13314@ladder01.news.aol.com>

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time,

however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments. I believe there is a version of BASIC called STOS available for free download.

We are a new site on the internet and we can supply your hardware needs. As a promotion to get our name out to you, we are running a special promotion on 32Meg simms. For a very limited time, we are selling 32Meg/70ns EDO simms for just 140+shipping and handling, delivered to your door within 2-3 days.

Just go to our site www.bytewarecafe.com and fill out the necessary information about yourself and your credit card information. Goto the products list and choose the memory item. From here, select the memory you want and click on the invoice button to see your total charges.

If you wish to browse the other hardware categories, feel free to browse for as long as you wish. If you wish to buy anything else, just select that item from that category.

If you are satisfied with your selection(s) and your personal information is correct, click on the submit order button. The bytewarecafe.com server will respond with an order number and a time stamp. You will need these two numbers for any future correspondences with bytewarecafe.com

Your order will be prepared and delivered to your door within 2-3 days.

Thank you.

Singletasking GEMDOS does not care who owns a memory block being Mfree'd.
This is true of all TOS versions. I believe MiNT is different, though,
even in unprotected mode.

 Sorry but STOS is commercial, and not available for download from
anywhere, never has been from my page and never will be,
 However there is a STOS file site for support programs and this I
presume is where the missunderstaning occured, an honest mistake by
the original poster <smile>

 Looking forward to this tutorial myself, but buggered if I can get
hold of a C compiler ???

Cheers.....!ynoT

LESSON 3 - printf()

First, a personal aside.

I am using America Online to connect to the internet and anything that I try to post longer than a page will cause a disconnect, so I am going to have to keep splitting up these lessons. Which means, inevitably someone will find themselves missing a part. In addition, some newsgroup servers are so pressed for space that some articles do not last very long. If you need a repost..let me know.

Also, I realize that the example C programs that I have use probably still look like a bunch of gibberish, but don't let that get you down. Like any language things will become more and more familiar to you in time, untill eventually you will wonder why you ever thought it was hard.

I thought long and hard about what the lesson plan should be today. Its a common fault of most tutorials to get bogged down with text formattting issues. Text formatting is great for understanding legacy applications, but not necessarily as important for programming a GUI (Graphical User Interface) environment like GEM.

Nevertheless, the GEM AES (Application Environment Services) will have to wait for more advanced lessons. So lets tackle printf() now, so we can begin programming today and so we can use it to display output as we continue learning the syntax of the C language.

As I mentioned in earlier lessons, printf() is not a C keyword, but a prewritten piece of code which is contained in virtually every C library. To be precise, it is contained in the header file stdio.h. (STanDard Input/Output) It is an output function.

--How do I recognize a function?

Good question. Every function from the main() function to the most obscure is always the functions name followed by a set of parenthesees. Sometimes there is information inside the parentheseees, such as:

```
printf("Print this");
```

the information in the parenthesees is passed to the function. In later lessons, we will cover in greater detail how information is passed to and from functions. For now, just remember when you use printf() you are calling a function, and information you place between the parentheseees is information you are passing to this function, which it will interpret and use to display information on your screen.

In the above example we are passing one argument. This arguement is the STRING CONSTANT "Print this"...we can pass more than one arguement to printf(). Consider the following example:

```
printf("My name is: %s","Robert");
```

within a C program, this would display:

```
My name is Robert
```

Why? Because %s is a FORMAT SPECIFIER. This tells printf() where to put a value and what kind of value to expect. %s tells it to look for a string. In this example the string is "Robert"

Lets take a look at another format specifier.

```
printf("I make %d per week",250);
```

This would display

I make 250 per week

newsgroups: comp.sys.atari.programmer
x-admin: news@aol.com

Why? because %d is a format specifier for a decimal integer value. It takes whatever is on the right of the comma and plugs it into the string on the left. Lets combine the previous two examples.

```
printf("My name is %s.  I make %d per week.","Robert",250);
```

What would this display?

In the above examples using format specifiers doesn't make much sense. It would be easier just to type out a string constant such as "My name is Robert. I make 250 per week" But remember, these are just examples, format specifiers do come in handy. Lets take another look at that Count.C program from Lesson 2 and see if it makes any more sense now!

```
/* Count.C         */
/* This program will
     count to 10 and
     display the output */

#include <stdio.h>  /* Header file where printf() is located */

main() {

     int count;

      for (count=1; count<11; count++)

           printf("\ncount=%d",count);
           getchar();
}
```

If we examine the printf() function call here, we can now see that the

value of count is substituted for '%d' We can also see a '\n' that is not printed when we run the program. That is because \n tells the printf() to start a new line. In typewriter speak, it technically does a carriage return and a line feed.

For extra credit. Delete the \n from the above program and recompile and re-run it.

As it turns out, the radio buttons and check boxes should be G_BUTTON with ob_flags bit 15 set. If the object has the radio button flag set then a radio button will be drawn.

There is no object type of "radio_button" or "check_box".

I was wanting to check for the presence of MagiC so that I can use MagiC
style radio buttons and check boxes when MagiC is present.

How should I be using appl_getinfo to determine whether MagiC style radio
buttons and checkboxes are present? I was unable to find a mode which
returned this information. (By "MagiC style readio buttons" I am referring
to a G_BUTTON object with ob_flags bit 15 set.)

OTOH, I will only be using this with MagiC. If an other AES supports the same feature, how would I know about it in order to use it? You mentioned previously about using appl_getinfo to find out, but I cannot find an appl_getinfo mode which returns the relevant information.

For example, Geneva supports the same feature, but it uses "extended type" 18 to indicate a radio button or checkbox. So I have to use individual support for each AES anyway.

Here is your assignment: Using format specifiers write a program, that states your name, age, and weight, on three lines. Use only one printf() call.

To help you out here is a template for your program.

```
/* NAMEOFPROGRAM.C */
/* THIS PROGRAM DOES SOMETHING */

#include <stdio.h>  /* You must use this preprocessor directive, because
it contains the printf() function */

main() {   /* the starting bracket tells the compiler where the main
function begins */

LOGIC GOES HERE

          getchar();   /* This waits for a return, so you have time to
read the output before the program ends */

}   /* Don't forget the ending bracket, the compiler needs to know where
the main function ends too!  */
```

Have you all been running into compiler errors? I'm sure you have! I have! Forgetting a quote or a semi-colon gives the compiler fits doesn't it? C is a very exacting language when it comes to syntax, but that is in part why it produces such great code!

oh yes, one other thing, the compiler strips out spaces, all the indentations are for readability and are traditional, they are not absolutely necessary.

For Pure C, you will first need to specify a Project File. Use the DEFAULT.PRJ file provided (use the Project/Select... menu item).

You might also need to specify the default directories where the headers and object libraries are located. I believe it works OK straight out of the box, though.

LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in order to allow your compiler to work. Other elements are by tradition or for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand everything about it at this time:

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */

#include <stdio.h>  /* This header file defines printf()  */

main() {
     int count;

     for (count=1; count<11; count++)

         printf("\ncount=%d", count);
         getchar();
     }
```

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */
```

A program starts with a comment that gives the filename and brief description of the program.
If you'll remember from lesson one, comments are simply remarks that are ignored by the compiler, but are useful reminders that aid other programmers in their understanding of your code. A remark begins (without the quotes) with a '/*' and must end with a '*/'

newsgroups: comp.sys.atari.programmer
x-admin: news@aol.com

```
#include <stdio.h>  /* This header file defines printf()  */
```

The next portion of a C program is the preprocessor directives. These are #include and #define. The preprocessor directives are for the benefit of the C compiler. The #include <stdio.h> tells the compiler that you will be using the stdio.h header file. This header file contains information about the printf() function. Confusing? Don't worry I'm just trying to give you an outline of a C program, we will cover header files again.

```
main() {
```

Remember, C is a structured language. That means you reuse code. over and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a language made up almost entirely of functions. Every C program contains a main() function, and by tradition main() goes first. Our example only has one function, but in real life C programs have many.

```
     int count;
```

Initializes a variable 'count' and tells the compiler that it will be an integer.

```
     for (count=1; count<11; count++)
```

A for loop, don't worry about this just yet.

```
         printf("\ncount=%d", count);
```

printf() is not a keyword! printf() is a function that is being called. We do not have to rewrite this function because it has already been written. The printf() is in the header file stdio.h which we told the compiler to use at the beginning of the program.

```
        getchar();   /* waits for the enter key before exiting */
```

getchar() is another function that is part of the stdio.h file.

```
     }
```

Clear as mud now? Don't worry, I just wanted to familiarize you with the makeup of a C program.
To Summarize: Start with some comments so you can remember what the program is all about later,
then you will do some preprocessor directives, such as telling the compiler what header files you
will be calling up in your program (what prewritten routines you will be borrowing), then you will write
the function main() which contains the logic of your program. Finally, you write any functions that
main() calls, but are not included in any header files(not necessary in this tiny example, but done in real life)

Lesson 1
Lesson 2
Lesson 3

I am working on Lesson 4 now, but I may pause for a bit to make sure everyone who is interested has got all the lessons...I know some of you are still searching out a compiler. I don't think any two people are using the same compiler, but if everyone gets to the end of Lesson 3 feeling fairly comfortable then I think we can move ahead without any hitches...

By the way, feel free to copy these articles, modify them, do anything with them you'd like ... except claim that you wrote them you stinkin bastard...

ooops, got a bit carried away there, ha! :-) Seriously, do whatever you'd like with them, I'm just writing these for my own edification and would love it if more people found them useful.

Happy New Year to All!

> I'm finding out the address of the te_ptext by using rsrc_gaddr()

> Is the address returned by doing this the actual address of the text
> or does the returned address just hold the address of the text?

Given code of the form:

```
TEDINFO *tip; /* TedInfo Pointer */

rsrc_gaddr( R_TEDINFO, itemnum, &tip );   /* get address of TEDINFO structure
                                              associated with TEDINFO #itemnum */
```

This call is useless, as it (and R_TEPTEXT, R_TEPTMPLT and R_TEPVALID) will not work as they requies the TEDINFO item number within the whole TEDINFO block in the resource file. This itemnum is not returned by most (all?) resource editors I know of.

Instead you need to use something of the form:

```
OBJECT *tree;

rsrc_gaddr( R_TREE, treenum, &tree ); /* get treee pointer */
tip = (TEDINFO *)tree[itemnum].ob_spec;
```

This will load tip with the address of the TEDINFO structure within that tree.

You can then get at the te_pvalid, te_ptext &c via "tip -> te_ptext" &c.

Wow, lovely discussion.

I'd like to ad a point. I use Gemulator and I cannot run any STOS games so far :-(

I initially thought I would not have any problems running games because Megaroids (written as a demo for the original Megamax C) works just fine.

This has just been my experience so far, but since my Atari ST, (TOS on disk!, its been that long...) was thrown away by my evil brother, who was looking after it...

Gemulator is all I have! And when I buy a real Atari Machine, it will probably be one of those high end systems....

If I had a real ST, I would probably be very glad for STOS, since apparrantly it has spurned the creation of many exciting games, but since I do not, I have to vote with the C crowd. Has anyone run the new Heartland through Gemulator? If it works let me know, I'd like to play it!

What is the size of a Form CPX dialog? For example: 304 by 152 pixels.

(Sods law says that the hypothetical numbers I have just quoted from the top of my head have just correctly answered my question)

I used to have it written down somewhere, but no longer seem to have it available.

I looked in the Compendium, but it appears to mention nothing on this subject.

Is there a good source of info on this subject?

d > I'm finding out the address of the te_ptext by using rsrc_gaddr

Actually, the index used to specify the TEDINFO may be difficult to
locate (unless the RSC has only one). One usually accesses it via
the ob_spec pointer:

```
    OBJECT *tree;
    char *p;

    rsrc_gaddr(R_TREE,T_NAME,&tree);
    p = tree[O_NAME].ob_spec.tedinfo->te_ptext;  /* Pure C */
or
    p = ((TEDINFO*) tree[O_NAME].ob_spec)->te_ptext;  /* Laser C */
```

where T_NAME and O_NAME represent the names you gave the tree and
object in your RSC editor (and defined in a header file provided).

I compiled the small C program from lesson 1,

The compiled program IS 23306 Bytes, sound right?

Using GST C...Anyone have any opinions on this C ???? please?

Cheers.....!ynoT

 Not doing a very good job of looking after it if he threw it away?

 It should...BUT....

STOS itself, the programming language does work under Gemulator,
therefore programs made should also work, if you have the rom cards
206 then everything should work fine, however if you are using a tos
image then its very doubtfull, also if you are using gemulator and
magiC then its also doubtfull as thats a different operating system,

 HTH :)

Thanks for the C code for this but unfortunately (as I stated in the
original posting) I'm using assembler and I do not know enough C to
work out what is happening in the above.

Toad is about the ONLY company tha still regards Atari computers as real
computers. Most of you guys still think of Atari as nothing more than a
game platform and sell them as a simple game server. Its the users of Atari

computers who have driven the prices down in private sales. A guy buys a 1040 for $700 and a few years later nobody will pay more than $50 for it. C'mon now folks, the hardware is much better than that. These are REAL computers, not nintendos.

Toad recognizes this fact and sells their stuff as real computers. They also stand behind their sales if something goes wrong. Toad currently sells a 1 meg 1040 for $199 and thats a very good and realistic price, but if a guy advertised one here for sale as an owner looking to sell his stuff, most of you would say thats too much for a 1040. SO admit it folks, either you have real computers or nintendos for sale in this group. I say that Atari made real computers and I bought them as such and will sell them as such when the time comes.

Tony-

I posted Lesson 2 in one big part...before I ever posted Lesson 3(4 parts)...however it seems that most people did not get Lesson 2, even though it is on the America Online newsgroup server OK... America Online keeps dropping the connection if I try to send out the lessons in one big message...so I have been forced to split them up...when I reposted Lesson 2, I split them up into two parts.

I like the idea of posting these lessons to the Newsgroup, so I will continue. In the future I will split up the pages and each page will be clearly marked (i.e. Lesson 4 page 1 of 4, etc.) AND I will post on the day when I said I was going to post the lesson so that people will have a chance to get them before the newgroup servers loses them. Btw, the AOL newsgroup server keeps about 350 msgs for this newsgroup, is this similar to your experience??

I will get back to you through Email on your other questions...

Subject: Intro. to C tutorial, part 1
From: rdupuy5596@aol.com (RDupuy5596)
Date: 30 Dec 1996 17:47:14 GMT
Message-ID: <19961230174500.MAA13314@ladder01.news.aol.com>

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific

goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time, however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments.

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!<<<---Do to the limitations of usenet, I have changed my mind you may Email me individually(01/01/97)

----Robert Dupuy

LESSON ONE - Get To Know Your Compiler.

If you'll recall from the introduction, the compiler is central to making a C application. The compiler translates the english-like syntax of your program into a binary (1's and 0's) that the computer can execute. In addition, since most C programs are broken into several segments, the compiler will link these segments together and will do some rudimentary error checking.

There are two types of compilers available: those that use and IDE (integrated development environment) and command line compilers. Megamax LaserC (which is the primary compiler for this tutorial) is a good example of an IDE compiler. In an IDE environment, the editor (used for typing in the C programs) and other functions are built in a easy to use shell. Command line compilers tend to be a little more cryptic. With a command line compiler you use any text editor or word processor to write your code. Error checking is harder to do with command line compilers, and you may have to learn and understand how to use scripts to keep track of various modules. Alcyon C that comes with the Atari Developers Kit is an example of a command line compiler. I highly recommend that you do not use a command line compiler to learn C.

The goal of this lesson is to familiarize yourself with how your compiler works and you will type in your first C program. It will not be necessary to understand this program, only to type it in EXACTLY as written, and to compile it.

First, if you have not done so already install Laser C. (or whatever compiler you are using). Refer to your documentation for help. If you still cannot install your compiler then post to this group and someone will help you out.

Double click on the Laser C icon. This will load the Shell and ram resident programs. If you will be using a command line compiler then load a text editor. Select the File menu, then select New. In the window type the following EXACTLY (case is important):

```
#include <stdio.h>
```

```
main() {
        printf("My first program\n");
        getchar();
             }
```

OK, now select the file menu again, and then select Save As. Save this file as First.C....

The file should now be saved to disk, you may change the name but be sure that it has the ".C" extension, this is necessary for your compiler to recognize it as a C program.. In Laser C, you may now pull down the Execute menu and select run. If you did not type any errors then Laser C will automatically compile and run the program. Hit return to exit the program. Now exit Laser C, you will find a program called First.prg on your disk. You may run the program again, if you'd like, just double click on it! (Remember to hit return to exit this program)

If you are using a command line compiler, please refer to the documentation. Command line compilers usually work by typing the name of the compiler followed by the program you wish to compile. Also there may be many options and several passes necessary to make them work. Please post to this group if you have questions about using your command line compiler.

EXTRA CREDIT

OK, you may add comments to any program by using the following format:

/* put comments here */

Got that? You type (without the quotes) "/*" to start a comment and a "*/" to end the comment.

The "/*" tells the compiler to ignore all text and the "*/" tells the compiler to stop ignoring text. Comments don't change the way your final program runs or the size of your final program in anyway, but they are usefull for making your long programs readable by other programmers or yourself. Here is the first.c, this time with comments

```
/*
This is my very first program
*/

#include <stdio.h>  /* This is a header file.  Header file's have the '.h'
extension */

/* Every C program has a function called 'Main' */

main() {
         printf("My first program\n");  /*print my first program */
         getchar();  /* Wait for return */
              }
```

Of course in real life, you would not use this many comments. Comments that only state the obvious detract from readability and our goal is to make our code as readable as possible!

OK, compile this program, its exactly the same as the first! See, I told you....

Thats it for lesson one, in the next lesson we'll go over the format of C programs and what functions are all about.

p.s. always remember to end a comment with the '*/' . Its a common mistake to just start a new line without ending the comment. The compiler ignores all text untill it reaches a '*/' so if you leave one out, the compiler will ignore the rest of the program!

LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in order to allow your compiler to work. Other elements are by tradition or for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand everything about it at this time:

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */

#include <stdio.h>  /* This header file defines printf()  */

main() {
     int count;

     for (count=1; count<11; count++)

         printf("\ncount=%d", count);
         getchar();
     }
```

```
/* Count.C             */
/* This program will
   count to 10 and
   display the output  */
```

A program starts with a comment that gives the filename and brief description of the program.
If you'll remember from lesson one, comments are simply remarks that are ignored by the compiler, but are useful reminders that aid other programmers in their understanding of your code. A remark begins (without the quotes) with a '/*' and must end with a '*/'

```
#include <stdio.h>  /* This header file defines printf()  */
```

The next portion of a C program is the preprocessor directives. These are #include and #define. The preprocessor directives are for the benefit
of the C compiler. The #include <stdio.h> tells the compiler that you will be
using the stdio.h header file. This header file contains information

about the printf() function. Confusing? Don't worry I'm just trying to
give you an outline of a C program, we will cover header files again.

X-Deja-AN: 207167425
organization: AOL http://www.aol.com
newsgroups: comp.sys.atari.programmer
x-admin: news@aol.com

```
main() {
```

Remember, C is a structured language. That means you reuse code. over
and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a
language
made up almost entirely of functions. Every C program contains a main()
function,
and by tradition main() goes first. Our example only has one function,
but in real life
C programs have many.

```
     int count;
```

Initializes a variable 'count' and tells the compiler that it will be an
integer.

```
     for (count=1; count<11; count++)
```

A for loop, don't worry about this just yet.

```
         printf("\ncount=%d", count);
```

printf() is not a keyword! printf() is a function that is being called.
We do not have to
rewrite this function because it has already been written. The printf()
is in the header
file stdio.h which we told the compiler to use at the beginning of the
program.

```
        getchar();   /* waits for the enter key before exiting */
```

getchar() is another function that is part of the stdio.h file.

```
     }
```

Clear as mud now? Don't worry, I just wanted to familiarize you with the makeup of a C program.
To Summarize: Start with some comments so you can remember what the program is all about later,
then you will do some preprocessor directives, such as telling the compiler what header files you
will be calling up in your program (what prewritten routines you will be borrowing), then you will write
the function main() which contains the logic of your program. Finally, you write any functions that
main() calls, but are not included in any header files(not necessary in this tiny example, but done in real life)

LESSON 3 - printf()

First, a personal aside.

I am using America Online to connect to the internet and anything that I try to post longer than a page will cause a disconnect, so I am going to have to keep splitting up these lessons. Which means, inevitably someone will find themselves missing a part. In addition, some newsgroup servers are so pressed for space that some articles do not last very long. If you need a repost..let me know.

Also, I realize that the example C programs that I have use probably still look like a bunch of gibberish, but don't let that get you down. Like any

language things will become more and more familiar to you in time, untill eventually you will wonder why you ever thought it was hard.

I thought long and hard about what the lesson plan should be today. Its a common fault of most tutorials to get bogged down with text formattting issues. Text formatting is great for understanding legacy applications, but not necessarily as important for programming a GUI (Graphical User Interface) environment like GEM.

Nevertheless, the GEM AES (Application Environment Services) will have to wait for more advanced lessons. So lets tackle printf() now, so we can begin programming today and so we can use it to display output as we continue learning the syntax of the C language.

As I mentioned in earlier lessons, printf() is not a C keyword, but a prewritten piece of code which is contained in virtually every C library. To be precise, it is contained in the header file stdio.h. (STanDard Input/Output) It is an output function.

--How do I recognize a function?

Good question. Every function from the main() function to the most obscure is always the functions name followed by a set of parenthesees. Sometimes there is information inside the parentheseees, such as:

```
printf("Print this");
```

the information in the parenthesees is passed to the function. In later lessons, we will cover in greater detail how information is passed to and from functions. For now, just remember when you use printf() you are calling a function, and information you place between the parentheseees is

information you are passing to this function, which it will interpret and use to display information on your screen.

In the above example we are passing one argument. This arguement is the STRING CONSTANT "Print this"...we can pass more than one arguement to printf(). Consider the following example:

```
printf("My name is: %s","Robert");
```

within a C program, this would display:

```
My name is Robert
```

Why? Because %s is a FORMAT SPECIFIER. This tells printf() where to put a value and what kind of value to expect. %s tells it to look for a string. In this example the string is "Robert"

Lets take a look at another format specifier.

```
printf("I make %d per week",250);
```

This would display

```
I make 250 per week.
```

\

newsgroups: comp.sys.atari.programmer
x-admin: news@aol.com

Why? because %d is a format specifier for a decimal integer value. It takes whatever is on the right of the comma and plugs it into the string on the left. Lets combine the previous two examples.

```
printf("My name is %s.  I make %d per week.","Robert",250);
```

What would this display?

In the above examples using format specifiers doesn't make much sense. It would be easier just to type out a string constant such as "My name is Robert. I make 250 per week" But remember, these are just examples,

format specifiers do come in handy. Lets take another look at that Count.C program from Lesson 2 and see if it makes any more sense now!

```
/* Count.C         */
/* This program will
     count to 10 and
     display the output */

#include <stdio.h>  /* Header file where printf() is located */

main() {

     int count;

      for (count=1; count<11; count++)

           printf("\ncount=%d",count);
           getchar();
}
```

If we examine the printf() function call here, we can now see that the value of count is substituted for '%d' We can also see a '\n' that is not printed when we run the program. That is because \n tells the printf() to start a new line. In typewriter speak, it technically does a carriage return and a line feed.

For extra credit. Delete the \n from the above program and recompile and re-run it.

Well I can been so entertained by this reproire that I feel I simply have to jump in and say "Well done!". Ypou two should write for a BBC comedy series, good family entertainment. Anyway, enough. I have come back to add a few more (useless?) points?

>>So you happily moved the goal! First was STOS better because it could to
>>blazing fast arcade games although it isn't as compatible as C is. Now STOS is
>>better because STOS is better (#define BETTER STOS). It's nicer to write games
>>in?... Let me summarize:

Hmm, don't remember that!

> What are you talking about ? I said that given the choice, STOS is
>the best language to make games in 1996 compared to any other BASIC, I

You did..

>then said that I would even add C, I never mentiond fast or
>compatability, please do not trry to put words into my mouth,

Fair point, words shoved in ones mouth can leave a bitter aftertaste if
they are off... ;)

> I have since stated some things, but I have not moved the posts, my
>original statment stands good, you have done nothing to prove it
>otherwise, you make a gallant attempt and you do get me into corners
>by talking a good debate,
>
Ahh, how honest of you Tony. A good debate, that is true. Over 100 posts
(most of which were between you two people). To me that is, indeed, a
good debate!

> But really at the end of the day we have to let the software do the
>talking, mine has, your has not.....figure that one out :)

True... unles the C version is released with AT LEAST the same graphics,
sounds, music, options, levels, gameplay, speed, etc of the original.
Add to it if you like Hans but we are still waiting... us STers!

>>* C works on all Atari systems, STOS doesn't

> The only computers a STOS written game does not work on is the so
>called supre computers, Hades and Madusa, I do not see that as a
>compatability problem, so your compatability argument although true,
>is pretty useless ?

Works on mine, so I'm okay Jack. No probs where I am...

>>* C produces working code for all Atari systems, STOS doesn't

> Is that not exactly the same point as above?, and I proved that to be
>a useless point...

True, the same point worded differently... unless in your 1st point you
mean you can not even run STOS on all machines let alone STOS-written
programs? Need to clear this one up Hans!

>>* C will work on newer (not yet existing) TOS versions, STOS won't

> How the hell can you make a statement like that, that is impossible
>to know, you are talking rubish here,

You are asuming that there will be newer TOS versions? Heheheh, are we
all going to wake up and Atari never really went away? Hehehe.

>>* C can do GEM game, STOS can't

> I think that is a dissadvantage to C, thus you just shot yourself in
>the foot,

I agreee, I have not seen a decent looking GEM game. GEM was most
certainly not designed to be used for arcade games I am sure.

>>* C produces faster code than STOS

> Yawn, so what, how fast do you want to PRINT "SOMETHING"

Very true. Okay, so it gives you more processing time to do other things
which might have to be omitted in STOS because you would not get the
free time. In assembler this time is enough but in C it must surely be
minimal, by comparison?

>>* C allows structured programming with functions and data structures,
>> STOS doesn't

> So what, that has got to be the one most stupid statement you have
>made, what point is there to that? you are right, but so what, I may
>as well say STOS is better because it uses line numbers? you seem to
>be scraping the bottom of the barrel for reasons here?

Or... at least STOS does not forse you to use stupid curly brackets ;)

The idea that structured programming = quicker processing is, as any
schoolboy home coder will know, a load of old wotsits. Why? Well, it may
well be easier to read and debug (this I agree is true) but as far as
faster processing? An unconditional "Goto" is often considered a
programming "sin". I have, in the past, done timed tests and found that
it is more often than not more processor effecient to skip true cyclic
programming.

Besides, STOS does allow structured programming if you wish to utilise
it. Functions may easily be created.

>>* C can be used for all kinds of programming, STOS can only do games

> WRONG, See other posting for proof positive that your statement is

>outlandishly ill-informed and to be honest, suprisingly cheap of you,

Oi! STOS can only do games? Rubbish! By that token C can only do
applications :P

>>* C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that

> eeerm again, so what? what is so good about that? it doesent seem to
>do the C "games" programmer any good does it..

Plus you can write subroutines in STOS which can easily be merged into a
program, so you are again wrong mister!

>>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

> "Get a life", if you find my replies to you have taken a sour tint to
>them, it is because you have taken to cheap insults like this, at no
>point have I ever made a personal insult to you, even this message you
>are quoting and replying to was not to you personally, yet you feel
>the need to personally insult me, you tell me to "get a life" ?,

Oooer!! Well Hans, here's some rope to help you out of that hole you
just fell in :)

>>games in, especially for unexperienced programmers, but it is
>>certainly not the best language to do games in.

> Yes it is....you are wrong, but it is not enough to be wrong, today
>you have to be childish and insulting, whats up, game not going to
>plan hahahaha

Hmm, this seems to be the feeling of so many bitter (?) people today.
They HAVE to be right. It is impossible for other people to have
anything correct to say which might contravene them. And you are right,
when they realise they have lost an arguement it gets personal!

>> > This thread IS having the desired effect and making some people
>> > realise that STOS is not as bad as it used to be,

Yes, shame Mandarin couldn't take teh heat and dumped it... they could
have relaunched it as STOS '97 with most of the popular
extensions/commands as default (freeing up more extensions!) and really
shown that STOS is a viable language for games and serious use. There
are still some uninformed peopel out there who think of STOS as a SEUCK
type of affair!

>>But still isn't as good as C always has been.

> I never said STOS was better than C, in fact I have made every effort
>to say that C is better than STOS,

> But if someone wants to make a game, then STOS is the best choice,

Exactly... hehhee, but just so you know... ">>But still isn't as good as C always has been."!!!! Just in case ;)

>>Yes, it moved from total utter crap to could be sensible.

> How childish :(

Well, Tny, you are obviously dealing with a real debator here... someone who like sdebating a lot, a kind of "mass debator"? ;)

> Please stop talking about how good you are, and start showing, I am
>not going to have a debate with someone who resorts to childish
>witterings and cheap insults.....Goodbye :(

Wahay... hear! hear! Go on Hans, release that version of Heartland... go for it!!! You have nothing to lose, as you say C is so much better that STOS. Therefore we are waiting the game of teh century!! Oh, not too difficult with the lack of new releases, that's true!

Ooh! I look around and think I am lost here. I only came here for a bit of a wind up. Mind you, STOS is better than C, we all know that !!!!

HAHAHA!!

Lighten up everybody... |-|appy |\|ew '/ear

p > Mfree and Fclose do not cause any harm, they may be called at
p > any time.

They may not cause harm, but they may not free the RAM or close the
file either.

p > So before using those ACCset and ACCreset calls you must
p > inquire whether you're with multi-tasking, and thus whether
p > you're allowed to use them.

Once again, if you are multi-tasking, cooperative or pre-emptive,
*prun will equal the accessory BPA (when you read it) unless it
isn't used at all (in which case changing it should do no harm).

(Actually, putting the test in is overkill, since at worst you will
be re-writing the current value.)

I'm not sure what you mean by "creating a radio_button or check_box".

>: Also, how can I check for the presence of MagiC?
>
>Check the TOS version number. It says 3.00 on my TOS 4.04 Falcon when

That would be unreliable, since any AES could be version 3.99, and any TOS
version could be 3.00. I was wanting to know how to check for the presence
of MagiC, not for the AES or TOS version number.

Surely there is some cookie that signifies that MagiC is present?

>in?... Let me summarize:

What are you talking about ? I said that given the choice, STOS is
the best language to make games in 1996 compared to any other BASIC, I
then said that I would even add C, I never mentiond fast or
compatability, please do not trry to put words into my mouth,
I have since stated some things, but I have not moved the posts, my
original statment stands good, you have done nothing to prove it
otherwise, you make a gallant attempt and you do get me into corners

by talking a good debate,

But really at the end of the day we have to let the software do the talking, mine has, your has not.....figure that one out :)

>* C works on all Atari systems, STOS doesn't

The only computers a STOS written game does not work on is the so called supre computers, Hades and Madusa, I do not see that as a compatability problem, so your compatability argument although true, is pretty useless ?

>* C produces working code for all Atari systems, STOS doesn't

Is that not exactly the same point as above?, and I proved that to be a useless point...

>* C will work on newer (not yet existing) TOS versions, STOS won't

How the hell can you make a statement like that, that is impossible to know, you are talking rubish here,

>* C can do GEM game, STOS can't

I think that is a dissadvantage to C, thus you just shot yourself in the foot,

>* C produces faster code than STOS

Yawn, so what, how fast do you want to PRINT "SOMETHING"

>* C allows structured programming with functions and data structures,
> STOS doesn't

So what, that has got to be the one most stupid statement you have made, what point is there to that? you are right, but so what, I may as well say STOS is better because it uses line numbers? you seem to be scraping the bottom of the barrel for reasons here?

>* C can be used for all kinds of programming, STOS can only do games

>* C can produce it's own libraries (language extensions), STOS needs
> assembley to do that

eeerm again, so what? what is so good about that? it doesent seem to do the C "games" programmer any good does it..

>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

"Get a life", if you find my replies to you have taken a sour tint to them, it is because you have taken to cheap insults like this, at no point have I ever made a personal insult to you, even this message you are quoting and replying to was not to you personally, yet you feel the need to personally insult me, you tell me to "get a life" ?,

>games in, especially for unexperienced programmers, but it is
>certainly not the best language to do games in.

Yes it is....you are wrong, but it is not enough to be wrong, today you have to be childish and insulting, whats up, game not going to plan hahahaha

> > This thread IS having the desired effect and making some people
> > realise that STOS is not as bad as it used to be,

>But still isn't as good as C always has been.

I never said STOS was better than C, in fact I have made every effort to say that C is better than STOS,
But if someone wants to make a game, then STOS is the best choice,

> > Ask Hans and anyone else, what they used to think of STOS, and ask if
> > they have changed there mind in the last couple of months,

>Yes, it moved from total utter crap to could be sensible.

How childish :(

Please stop talking about how good you are, and start showing, I am not going to have a debate with someone who resorts to childish witterings and cheap insults.....Goodbye :(

Cheers.....!ynoT

>You did? Well, yes, from STOS point of view, STOS is best for making games

 Well done Hans, you just ended this thread...thanks :))

>because it's the only thing it can be used for. But that doesn't matter to this

 WHAT!!!!!!! eh? what do you mean its the only thing it can be used
for, we went through this once and I proved you wrong once,

 eg: there are more diskzines in the UK using a STOS written shell
than any other,
 eg: The only multimedia displayer for a FM that allows text,
animation, sampled sound, music, colourd text, choice of fonts etc in
the one file is a STOS program

 And other peoples software, well how about Video Supreme? show me a
rival to that, or how about grafix, both are COMMERCIAL programs, NOT
games and are STOS, Education titles, STOS surely rules in that
department, there are lots of instances of STOS in public domain and
commercialy released software that are not games,

 You say STOS can only do games, ???? You are wrong again.....

>discussion, because we were comparing STOS with other languages and then STOS is
>way behind C, even on it's speciality: arcade games.

  So you keep saying, I proved STOS is better, and until you can prove
otherwise then you are wrong, talk is cheap!

>intention is to write real cool games and you don't want to use assembley you
>have to use C for the best results, not STOS.

 again, I proved STOS is best, now you please stop talking and start
proving...yes?

> > what is the point of that, you must make a better version or say STOS
> > is best.....

>Well, by writing a faster game I proved C is at least on par with STOS on the

NO NO NO, you have talked about it, you have proved nothing, I showed
you a good arcade style , fast smooth game, you have not showed me a
arcade type game written in C, you just talked about it, that is NOT
proof,

>allow you to show a too big screen and the game is also faster. In arcade games
>bigger and faster usually is better.

In YOUR opinion...

> > you mean it takes MORE than reading a joystick ?
>
>No, where did I say that? reading the joystick has to be done by a intterupt

You accused me of not adding Joypad support because the main loop
could not handle the time, I say I already check for joystick, so in
the options screen someone chooses a jagpad then I simply swap a few
pointers and the routine looks for jagpad instead of joystick, same
time, no problem....so me not including jagpad was because I havent
got one to test with, and NOT because of proc time as you suggest,
your wrong again,

> >> Requests for the finished game can be send to:
> >> mr_ni@mst.tn.utwente.nl
> >
> > yes request it, talk about it....but we still have not seen it?
>
>It will be released. Please allow me some time to finish the product. It will
>be finished before februari 1997.

So you get a couple of months brainwashing everyone by telling them
you can do it, you tell everyone its faster and better and you tell
everyone you have proved it,
Why not wait until you have done it before you start telling everyone
how good you are ?

Cheers.....!ynoT

Well, since you guys have turned this newsgroup into the "MPLIBTYPL"
instead of the forum for exchanging programming info that it was
intended for, I guess I have no further use for the waste of
bandwidth. I'm unsubscribing.

It's a damn shame that Atarians have to act like Sinclap.

If ob_flags bit15 is set in a normal G_BUTTON then a toggle is drawn.
If the button is a radio button then a Mac style radio button will be
drawn instead. Normal Gem ignores this and displays the usual way.

>Also, how can I check for the presence of MagiC?

Look in the cookie jar for MAGX. It contains a pointer to the
MAGX_COOKIE structure which is defined in magx.h.

The Atari Compendium CD has all sorts of things, including some of the
more recent standards for GEM interfaces, etc. It also contains a lot
of associated source code and samples, as well as the docs on AES,
VDI, XBIOS, etc. I got mine for about $30 USD.

Hope this helps,
John

Well I can been so entertained by this reproire that I feel I simply
have to jump in and say "Well done!". Ypou two should write for a BBC
comedy series, good family entertainment. Anyway, enough. I have come
back to add a few more (useless?) points?

>>So you happily moved the goal! First was STOS better because it could to
>>blazing fast arcade games although it isn't as compatible as C is. Now STOS is
>>better because STOS is better (#define BETTER STOS). It's nicer to write games
>>in?... Let me summarize:

Hmm, don't remember that!

> What are you talking about ? I said that given the choice, STOS is
>the best language to make games in 1996 compared to any other BASIC, I

You did..

>then said that I would even add C, I never mentiond fast or
>compatability, please do not trry to put words into my mouth,

Fair point, words shoved in ones mouth can leave a bitter aftertaste if
they are off... ;)

> I have since stated some things, but I have not moved the posts, my
>original statment stands good, you have done nothing to prove it
>otherwise, you make a gallant attempt and you do get me into corners
>by talking a good debate,
>
Ahh, how honest of you Tony. A good debate, that is true. Over 100 posts
(most of which were between you two people). To me that is, indeed, a
good debate!

> But really at the end of the day we have to let the software do the
>talking, mine has, your has not.....figure that one out :)

True... unles the C version is released with AT LEAST the same graphics,
sounds, music, options, levels, gameplay, speed, etc of the original.
Add to it if you like Hans but we are still waiting... us STers!

>>* C works on all Atari systems, STOS doesn't

> The only computers a STOS written game does not work on is the so
>called supre computers, Hades and Madusa, I do not see that as a
>compatability problem, so your compatability argument although true,

Works on mine, so I'm okay Jack. No probs where I am...

>>* C produces working code for all Atari systems, STOS doesn't

> Is that not exactly the same point as above?, and I proved that to be
>a useless point...

True, the same point worded differently... unless in your 1st point you
mean you can not even run STOS on all machines let alone STOS-written
programs? Need to clear this one up Hans!

>>* C will work on newer (not yet existing) TOS versions, STOS won't

> How the hell can you make a statement like that, that is impossible
>to know, you are talking rubish here,

You are asuming that there will be newer TOS versions? Heheheh, are we
all going to wake up and Atari never really went away? Hehehe.

>>* C can do GEM game, STOS can't

> I think that is a dissadvantage to C, thus you just shot yourself in
>the foot,

I agreee, I have not seen a decent looking GEM game. GEM was most
certainly not designed to be used for arcade games I am sure.

>>* C produces faster code than STOS

> Yawn, so what, how fast do you want to PRINT "SOMETHING"

Very true. Okay, so it gives you more processing time to do other things
which might have to be omitted in STOS because you would not get the
free time. In assembler this time is enough but in C it must surely be
minimal, by comparison?

>>* C allows structured programming with functions and data structures,
>> STOS doesn't

> So what, that has got to be the one most stupid statement you have
>made, what point is there to that? you are right, but so what, I may
>as well say STOS is better because it uses line numbers? you seem to
>be scraping the bottom of the barrel for reasons here?

Or... at least STOS does not forse you to use stupid curly brackets ;)

The idea that structured programming = quicker processing is, as any
schoolboy home coder will know, a load of old wotsits. Why? Well, it may
well be easier to read and debug (this I agree is true) but as far as
faster processing? An unconditional "Goto" is often considered a
programming "sin". I have, in the past, done timed tests and found that
it is more often than not more processor effecient to skip true cyclic
programming.

Besides, STOS does allow structured programming if you wish to utilise
it. Functions may easily be created.

>>* C can be used for all kinds of programming, STOS can only do games

> WRONG, See other posting for proof positive that your statement is
>outlandishly ill-informed and to be honest, suprisingly cheap of you,

Oi! STOS can only do games? Rubbish! By that token C can only do
applications :P

>>* C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that

> eeerm again, so what? what is so good about that? it doesent seem to
>do the C "games" programmer any good does it..

Plus you can write subroutines in STOS which can easily be merged into a

program, so you are again wrong mister!

>>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

> "Get a life", if you find my replies to you have taken a sour tint to
>them, it is because you have taken to cheap insults like this, at no
>point have I ever made a personal insult to you, even this message you
>are quoting and replying to was not to you personally, yet you feel
>the need to personally insult me, you tell me to "get a life" ?,

Oooer!! Well Hans, here's some rope to help you out of that hole you
just fell in :)

>>games in, especially for unexperienced programmers, but it is
>>certainly not the best language to do games in.

> Yes it is....you are wrong, but it is not enough to be wrong, today
>you have to be childish and insulting, whats up, game not going to
>plan hahahaha

Hmm, this seems to be the feeling of so many bitter (?) people today.
They HAVE to be right. It is impossible for other people to have
anything correct to say which might contravene them. And you are right,
when they realise they have lost an arguement it gets personal!

>> > This thread IS having the desired effect and making some people
>> > realise that STOS is not as bad as it used to be,

Yes, shame Mandarin couldn't take teh heat and dumped it... they could
have relaunched it as STOS '97 with most of the popular
extensions/commands as default (freeing up more extensions!) and really
shown that STOS is a viable language for games and serious use. There
are still some uninformed peopel out there who think of STOS as a SEUCK
type of affair!

>>But still isn't as good as C always has been.

> I never said STOS was better than C, in fact I have made every effort

Exactly... hehhee, but just so you know... ">>But still isn't as good
as C always has been."!!!! Just in case ;)

>>Yes, it moved from total utter crap to could be sensible.

> How childish :(

Well, Tny, you are obviously dealing with a real debator here... someone
who like sdebating a lot, a kind of "mass debator"? ;)

> Please stop talking about how good you are, and start showing, I am
>not going to have a debate with someone who resorts to childish
>witterings and cheap insults.....Goodbye :(

Wahay... hear! hear! Go on Hans, release that version of Heartland... go for it!!! You have nothing to lose, as you say C is so much better that STOS. Therefore we are waiting the game of teh century!! Oh, not too difficult with the lack of new releases, that's true!

Ooh! I look around and think I am lost here. I only came here for a bit of a wind up. Mind you, STOS is better than C, we all know that !!!!

HAHAHA!!

Lighten up everybody... |-|appy |\|ew '/ear

HI,

I suggest MEGAMAX C, if you can find a copy of it. It came originally with a visual design interface and code generator for the atari STs and GEM.

This was a 2 pass compiler and made excellent 68000 code. The other quality C compiler for the STs was the Lattice C compiler. I think Michtron was handling that one last I looked.

regards.

Pete

> ===Ben===

Ben, I used to hate it when people said that Atari was dead. But now
its true.
There is no more Atari computer company. Your 'Multisync Switch Box' is
not
only totally unnecessary on new equipment (the need for such was just a
way to

sell monitors anyway), but you can make one yourself with a small platic box
and a rotary switch. Total cost about $5-$10 and 30 mins to an hour of work.
So, forgive me if I'm not floored at the loss of the WonderTech and his super switch box.

Toad prices suck. All Atari prices such. A Pentium 90 w/512K cache, dual EIDE
controllers, dual 16550 UART serial ports, parallel, full PCI, etc, is $250!
Add a case, hard disk, monitor, and keyboard - all of which can be had at your
local sidewalk sale for pennies, and you have a decent machine. Add Linux for
an OS and you never have to look at MicroSloth either. I hate Intel, but the
ST just doesn't have the power, and its WAY too expensive to upgrade. That's
why I dumped the Atari 8-bit - upgrade was too expensive. Now there isn't any
cheap Atari to upgrade too. Sure a Hades would be great, but if I was gonna
buy another unsupported piece of hardware, I'd get a BeBox - at least that has
some upgradeability and a decent price point.

CYA,
Evan

On 29 Dec 1996 01:16:16 GMT, in comp.sys.atari.programmer you wrote:

>Well, since you guys have turned this newsgroup into the "MPLIBTYPL"

 We are discussing the most appropriate programming language between

BASIC and C for making games, please try to understand the thread
before complaining,

>instead of the forum for exchanging programming info that it was

 Ho realy ?, read some of the messages, there is more programming
information in this thread than you will find anywhere else, STOS and
C and other BASICS have all been covered, Yes a fair amount of
bickering that we happen to be enjoying thank you,

 Nevertheless if you look then you will see a hell of a lot of
programming information, all you have to do is look?,

 For examply this is a STOS thread, yet I have learnt more about C
than I ever learnt anywhere else, Hopefully others have learnt about
STOS, try looking at the positive, not the negative,

 Your suggestion that programming information has not been exchanged
in this thread is..is well just rediculous to the extreme,

>intended for, I guess I have no further use for the waste of
>bandwidth. I'm unsubscribing.

 That is your choice, maybe if we start to talk about knitting then
that will be acceptable ?, but we have a saying for the above, it's
called "Cutting off your nose to spite your face"

>It's a damn shame that Atarians have to act like Sinclap.

 You may not like this thread, but it is on topic, it does comply with
the spirit of the newsgroup by the fact that it is about programming
and there is a lot of information, SO WHY HAVE YOU JUST MADE A
PERSONAL INSULT TO ME ??

 We all know it would have been simple for you to ignore this thread,
but instead you felt the need to jump in and make ill informed
statements and personal insults :(

Cheers.....!ynoT

I am trying to learn how to program GEM applications in assembler but
I'm having trouble finding out what text was entered in editable
fields from dialogue boxes.

Can anyone help me with this or point me to somewhere that I can get
more info on the structure of TEDINFO? (on line preferable as I can't
really afford to buy any books on the subject)

 >> games
 >
 > Well done Hans, you just ended this thread...thanks :))

This is an argument of type 1. The best programming language to do something in is the computer language you know best. No discussion possible on this point. In this thread we are discussing which programming language is the best one to write games in.

Most important part is here the speed of the resulting game (because the thread evolved to the arcade game type, and arcade games need smooth animations and fast response to user action, to accomplish that the language has to be fast.)

 >> because it's the only thing it can be used for. But that doesn't

I know, I was stating things a bit black white. STOS was primary written as an game programming language, and ofcourse, you can do other things with susch a language.

 >> discussion, because we were comparing STOS with other languages and
 >> then STOS
 > is

I can prove it, the code is running overhere, for now you simply have to believe me, to morrow (30-12-1996) you can test the game (that is if the mail wont be screwed up again).

 >> intention is to write real cool games and you don't want to use

I will, I told you I will, so I will, is it so hard to believe what I am

claiming? Or are you eager to get a better version of the game?

>> Well, by writing a faster game I proved C is at least on par with STOS
>> on the

> your wrong again,

No, I am reading Jouystick cursor keys and you pad at the same time. You can play whith any of them and change at all times. So I need time to scan the keyboard and get the joystick actions and time to read the joypad. So more input devices will take more time in my case.

> So you get a couple of months brainwashing everyone by telling them
> you can do it, you tell everyone its faster and better and you tell
> everyone you have proved it,
> Why not wait until you have done it before you start telling everyone
> how good you are ?

Either I have to be called sneaky devil because I am not telling I was working on the game or I am salling vapor ware. My delemma is that I have to prove that C is better and at the same time I want to do a realy good game, not just a bit of a game just lloking like heartland, but a bit better like you ask. That will take time. So I am gaving away a preview right now and will release the completed game in a month.

Bye, Hans Wessels

STOS is the best language to make games in 1996.
Can I make a GEM game? No.
Can I make a game for a so called super computer? (including TT's) No.
Will my game work on a not yet released TOS version? No.

Why should I use STOS then?

In <32b03219.1215756@news.airtime.co.uk> Tony Greenwood wrote:
...
> I still feel STOS would taking the above into consideration be the

>choice is easy :)
...

Now you are on the point saying STOS isn't as fast as C is. Please tell me what's left except your feeling STOS is better? What arguments are left for STOS?

 >> * C works on all Atari systems, STOS doesn't
 >
 > The only computers a STOS written game does not work on is the so
 > called supre computers, Hades and Madusa, I do not see that as a
 > compatability problem, so your compatability argument although true,
 > is pretty useless ?

It isn't working on the TT too. Useless? Please let the programmer decide on which computers the game should work, not the programming language. Are you to decide super computer owners shoulnd't have games?

 >> * C produces working code for all Atari systems, STOS doesn't
 >
 > Is that not exactly the same point as above?, and I proved that to be
 > a useless point...

No, the first is you can program on al the computers, that is writing the code compiling the code into a complet program. The second point is on which systems should the compiled code work. I am writing code on my ST targeted for all other Atari computers, or in the case of heartland 2.0 targeted to ST, STe, Falcon and TT. An hades owner can write code on his Hades that is ment to be used on an ST. So the first is development, the second is the target platform Clearly two different things.

 >> * C will work on newer (not yet existing) TOS versions, STOS won't
 >
 > How the hell can you make a statement like that, that is impossible
 > to know, you are talking rubish here,

No, not in case of STOS. STOS has a table with the OS adress of certain routines or tables. In a newer OS the adres will probably be different. Most other languages use trapes and documented system vectors to acces the OS.

 >> * C can do GEM game, STOS can't
 >
 > I think that is a dissadvantage to C, thus you just shot yourself in
 > the foot,

Please explain me why... You don't have to use GEM, you CAN use GEM. The choise is to the programmer.

>> * C produces faster code than STOS
>
> Yawn, so what, how fast do you want to PRINT "SOMETHING"

How fast do you want to display your background sprites?

>> * C allows structured programming with functions and data structures,
>> STOS doesn't
>
> So what, that has got to be the one most stupid statement you have
> made, what point is there to that? you are right, but so what, I may
> as well say STOS is better because it uses line numbers? you seem to
> be scraping the bottom of the barrel for reasons here?

Data structures and functions are usefull in more advanced games like tet adventures board games with an 'intelligent' computer opponent.

>> * C can be used for all kinds of programming, STOS can only do games
>
> WRONG, See other posting for proof positive that your statement is
> outlandishly ill-informed and to be honest, suprisingly cheap of you,

Yes it is, I was thinking about a lot of GEM stuff and so on, maybe even a compression program?

>> * C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that
>
> eeerm again, so what? what is so good about that? it doesent seem to
> do the C "games" programmer any good does it..

Well, I designed some routines for heartland. I might put those together in a library for next time use?

> "Get a life", if you find my replies to you have taken a sour tint to
> them, it is because you have taken to cheap insults like this, at no
> point have I ever made a personal insult to you, even this message
> you are quoting and replying to was not to you personally, yet you
> feel the need to personally insult me, you tell me to "get a life" ?,

If getting a live is insulting I will take my words back. I underestimated the power of that saying then. I thought I was a proper way to ask you to review all arguments again.

>> But still isn't as good as C always has been.
>
> I never said STOS was better than C, in fact I have made every effort
> to say that C is better than STOS,
> But if someone wants to make a game, then STOS is the best choice,

That is not the same as saying STOS is the best game language. If someone wants to make a game the programming language he knows best is the best choise. It's

not possible to argue about that. We can only argue about which wich language can make the best game.

Bye, Hans Wessels

Trust me, it will be there. I can either rush a same version out right now (with al larger visible play field) or a far better version within a month?

Which one do you want?

>>> * C will work on newer (not yet existing) TOS versions, STOS won't

> we all going to wake up and Atari never really went away? Hehehe.

There are new TOS versions (patched versions) in the new super computers. A complete new TOS comaptible OS is called magic. I think there will be a day there won't be TOS in ROM but Magic. There is the phenix project develloping a new TOS version. So yes, there are still changes for a new TOS version.

>>> * C can do GEM game, STOS can't
>
>> I think that is a dissadvantage to C, thus you just shot yourself in
>> the foot,
>
> I agreee, I have not seen a decent looking GEM game. GEM was most
> certainly not designed to be used for arcade games I am sure.

That's true, but you DON'T to have use GEM, you CAN use GEM if you want. For example if you want to write a game like Free cell. This is exactly what I mean with moving goal posts. You are thinking about arcade games for ST's. A best programming language for games has to do all king of games, GEM and non GEM. Otherwise it's something like the best programing language for arcade games.

>>> * C produces faster code than STOS
>
>> Yawn, so what, how fast do you want to PRINT "SOMETHING"

> be minimal, by comparison?

Well, in my version of heartland I can show a game area of 160 lines on screen instead of 128 let mes see... 160/128*100% = 125% so 25% more screen. I wouldn't call that minimal.

Can I set the ob_spec field of the G_BUTTON to a null pointer if I do not
want any text to be drawn beside the radio button or check box? (I don't
have MagiC myself, so I can't test this.)

Also, how much room should I allow for the button? Under Geneva, for
example, an extra three characters are taken up with the button, so the
object must be made three characters wider than the text.

Thank you for your help.

Well, Tony, it seems you still enjoying our little discussion. A was afraid I had gone too far... Phew! :-)

Bye, Hans Wessels

PS: Just after I gave the new game to Arnoud to send it to you (did you receive it already?) I discovered a bug. :-((Let's call it the well known demo effect.) When viewing the map I am scanning joysticks and joypad for the fire button to contine the game, even on normal ST's but on an ST there is no joypad, so a bus error is generated. This won't happen on STe's because joypads are possible there, only ST's and TT have this bug.

The TEDINFO structure lets a user edit formatted text. The object types G_TEXT, G_BOXTEXT, G_FTEXT, and, G_FBOXTEXT use their ob_spec pointers to point to TEDINFO structures.

```
+----------+------------+-----------+------------+

+----------+------------+-----------+------------+
|                  te_pvalid                       |
+----------+------------+-----------+------------+
|      te_font          |       te_resvdl       |
+------------+-----------+-----------+-----------+
|       te_just        |        te_color        |
+---------+------------+------------+-----------+
|     te_resvd2       |    te_thickness    |
+----------+------------+------------+-----------+
|     te_txtlen        |       te_tmplen     |
+----------+------------+------------+-----------+
```

te_ptext - A POINTER to the actual text.

If the first text character is "@", the field is blank, and the application can use any characters for the remainin character posistions in the field. For example, a te_ptext string "@xyzpdq" is seven blank spaces.

te_ptmplt - A POINTER to a text string template for any further data entry. The editable portion of the field is represented by underscores.

te_pvalid - A POINTER to a text sting containing characters that validate any entered text.

9 - allow only digits 0 - 9
A - allow only uppercase A - Z plus space
a - allow upper- and lowercase A- Z, plus space
N - allow 0 - 9 and uppercase A- Z, plus space
n - allow 0 - 9 upper- and lowercase A- Z, plus space
F - allow all valid DOS filename characters, plus ? * :
P - allow all valid DOS pathname characters, plus \ : ? *
p - allow all valid DOS pathname characters, plus \ :
X - allow anything

te_font - A WORD identifying the font used to draw the text.

3 - system font: used in menus, dialogs, etc.
5 - small font: used in icons

te_resvdl - Reserved for future use

te_just - A WORD identifying the type of text justification desired.

0 - left-justified
1 - right justified
2- centered

te_color - A WORD identifying the color and pattern of box-type objects.

te_resvd2- Reserved for future use

te_thickness - A WORD containing the thickness in pixels of the border of the text box. This WORD can have the following values:

00 = no thickness

1 - 128 (positive values) = inside thickness: inward from the object's edge
-1 - (-127) (negative values) = outside thickness: outward from the object's edge

te_txtlen - A WORD containing the length of the string pointed to by te_ptext.

te_tmplen - A WORD containing the length of the string pointed to by te_ptmplt.

The following example illustrates how the TEDINFO structure works.

- te_ptext is a string of raw data for a date. Its value is "061384".

- te_ptmplt, also a sting, is a template that shows how to display the data in te_ptext. Its value is "Enter Date: __/__/__".

- te_pvalid is a string of input validation characters. Its value is "999999".

- The editable text facility merges all the above data in one sting, "Enter Date: 06/13/84".

- If the user types "1004", the string becomes "Enter Date: 10/04/84".

- If the user presses the Backspace key after typing "1004", the string become "Enter Date: 10/0_/84".

- If te_ptext has no data or not enough data to fill out the template, the unfilled parts of the template show underscores

Here is your chance to learn C!

Starting January 1st I will be posting lessons on about a biweekly basis on the C programming language. I will be concentrating on the basics of ANSI C, and will move on to Atari specific subjects if there is interest.

I will be using Laser C, but I don't think there will be many compiler specific issues. Nevertheless, I will help anyone who so desires, locate a copy of Laser C...

I plan on going over the basics for about 15 lessons, give or take, and then I will see what kind of interest there is in continuing.

MagiC registers a cookie called "MagX". The cookie value is a pointer to the following structure (-> MAGX. H):

```
typedef struct
  {
            long                  config_status;
            DOSVARS        *dosvars;
            AESVARS        *aesvars;
  }  MAGX_COOKIE;
```

- config_status is the configuration bit-vector, which can be changed using the configuration module MAGXCONT.CPX (or MAGXCONF.ACC).

- dosvars is a pointer to a DOSVARS structure:

```
      typedef struct
  {
            char                      *in_dos;  /* DOS semaphore
address    */
            int                         *dos_time;   /* DOS time
```

```
address  */
                int                        *dos_date;    /* DOS date
address */
                long                      res1;
                long                      res2;
                long                      res3;        /* alway 0L */
                void                       *act_pd;   /* current program
*/
                long                       res4;
                int                          res5;
                void                        res6;
                void                        res7;   /* internal DOS
memory list */
                void                        (*resv_intmem) ();    /*
extends DOS memory */
                long                        (*etv_critic)();   /*
etv_critic handler */
                char                        *((*err_to_str)(char e)); /*
conv. error to text */
                long                        res8;
                long                        res9;
                long                        res10;
} DOSVARS;
```

- aesvars points to an AESVARS structure:

```
     typedef struct
     {
               long           magic;                      /* must be
$87654321  */
               void            *membot;                 /* end of AES
variables */
               void            *aes_start;               /* start address
          */
               long            magic2;                   /* is "MAGX"
          */
               long            date;                       /* date
ddmmyyyy        */
               void            (chgres)(int res,int txt);  /*chg.
resolution  */
               long            (**shel_vector)(void);     /* resident
desktop   */
               char            *aes_bootdrv;
               int               *vdi_device;  /* VDI driver used by AES
*/
               void             *reservd1;
               void             *reservd2;
               void             *reservd3;
               int                version;
               int                release;
} AESVARS;
```

These variables are read only.

OK, I cannot believe I have typed this much! I got that out of the Magic 2.0 manual.... also in the manual is a C routine which test whether Magic exists and also returns the version number. You can purchase a copy of magic from Toad at www.ataricentral.com

I hoped that I have been of some help!

Hans.....

Having just tried your version of Heartland, I am suprised, it is very good, not as good as the original, But I can see it will be and will maybe even pass it.....

So C is better at making games than STOS is.....now we know ?

However...given the choice, I would use STOS, it's more fun :)

Cheers.....!ynoT

>write games in.

 Well you may be, I am not?, I am discussing the programming language
someone would choose to use to make a game at this moment in time,
 You may well prove that C is faster and more compatable, I don't
actualy dispute that, I say its NOT the game makers choice, the choice
does not have to be the fastest, it is maybe the most apt, especialy
for someone who has never programmed before and wants to make a game
for the ATARI,

>Most important part is here the speed of the resulting game (because the thread
>evolved to the arcade game type, and arcade games need smooth animations and

>fast response to user action, to accomplish that the language has to be fast.)

 You seem pre-occupied with speed, I will say C is faster, there!
Happy!, but still it would not be most peoples choice to make a game
in if they have STOS to choose from, the advantages of using C do not
compensate having to use C, ie no one in there right minds is making
games in C, but lots of people are making them in STOS.....

> > WHAT!!!!!!! eh? what do you mean its the only thing it can be used
> > for, we went through this once and I proved you wrong once,

>I know, I was stating things a bit black white. STOS was primary written as an
>game programming language, and ofcourse, you can do other things with susch a

 Official name is...."STOS The Game creator", however it has evolved
so much that it can no longer be compared with the original,

> > proving...yes?

>I will, I told you I will, so I will, is it so hard to believe what I am
>claiming? Or are you eager to get a better version of the game?

 I have it, I have it :)

> >> allow you to show a too big screen and the game is also faster. In
> >> arcade games bigger and faster usually is better.

> > In YOUR opinion...

>Please tell me yours. Whats a good arcade game? It has to be fast and smooth,
>doesn't it?

 But not neccasarilly bigger, maybe a status/life/objects etc bar is
needed, maybe it is such a game that big icons showing the above is
needed, maybe some other information has to be shown, as arcade type
games are usually aimed at younger children then tiny status bars are
out, so full screen games are not always a good idea, thus smaller is
better?

> > time, no problem....so me not including jagpad was because I havent
> > got one to test with, and NOT because of proc time as you suggest,

 Thank goodness, who wants a game in black and white with orrible

green and a splash of red :(

>Can I make a game for a so called super computer? (including TT's) No.

 I don't see this as much of a problem, I will be able to include TT
by the next game I release as that has been sorted already, theres
only madusa and hades I cannot support..so what ?

>Will my game work on a not yet released TOS version? No.

 YES!....Give us a new TOS version and it will be fixed for it just
like all the rest have ?

>>is they cannot manage anything that needs speed,timing and power, the
>>choice is easy :)

>Now you are on the point saying STOS isn't as fast as C is. Please tell me

 I do not recall ever saying STOS was faster than C, I would never say
such a thing, I have stated STOS is the better choice for making
games, not that it is faster?,

>It isn't working on the TT too. Useless? Please let the programmer decide on

 the next game (according to the author of the generic fixer) will be
able to work on a TT, it will also work on a falcon without the use of
backwards, by having code inserted that will set the machines to 8mhz
and atari st low :)

I personally haven't dealt with Toad since I met the Troy's at an
Atari show several years ago. They had a bin full of 8-bit carts that
were selling for $10 a piece (even though you could find them
elsewhere at the show for a buck or two). Anyway, I found a rare cart
in there and when they saw me looking at it, Mrs. Troy literally
snatched it out of my hands from across the booth and rudely told me
it wasn't supposed to be in the bin! I'd never had someone do this to
me before or since, even with all the hostile people I've dealt with
at flea markets over the years, and I was quite pissed! There could
have been another way to tell me the stupid thing wasn't for
sale...Anyway, I appreciate that they support Atari after all these
years, but get real...they have always charged close to full retail
for EVERYTHING, since the very beginning. How the hell did they
survive this long dealing Atari wares when all the good vendors fell
by the wayside?

Just my 2 cents worth...

Ah, but in this case...is it not true that the system is devoted to only
the "child" process until you exit it?

Mind you, I'm no programmer..but I know that from time to time I run
across a program that launches another...such as the way Ant Mail opens
an external editor. Some programs ask the AES to open the application
(like later versions of Ant Mail), and this way your system is still free
to multi task...co-operative, or pre-emptive, and you can choose different
applications that may be running in the mean-time. Other programs will
launch it as a child application, and you're stuck there...all else
sleeping...until you finish and exit from the "child" process. I suppose
the better written programs will check to see what AES is loaded, and use
the best method for that system (isn't that what the cookie jar is for?).

: Why is functionality reduced ? Because others than MagiC's AES do not
: bring preemptive multitasking ? That is not MagiC's fault.

See above comments...
Some programs that don't tell the AES an application is open, or out-right
have the AES open it, severely limit your flexability as a user. A good
example is an experience I've had with using Oasis and NOS in Geneva.
Oasis does not tell the AES when it opens another program...hence, you
can't multi-task at all when one of these "child processes" are open.
In this case, I like to run NOS in the back ground, and use Oasis as an
online reader. When Oasis calls one of its many editors, everything else
goes to sleep until that editor is closed! While the TCP/IP stack sleeps,
the internet provider grows inpatient from a lack of activity and hangs up
on me. A good example of an application that works well is Ant Mail...it
will have the AES open your editor...hence I can write email, browse the
web, do irc chat...and much more all at once and nothing sleeps while I'm
using the Ant-Mail-launched-editor unless I tell it to!

I agree fully...
A top notch program will check to see what is the best method depending
upon what it runs under. Geneva may recommend one way...MagiC another,
and the many AES/TOS versions even another.

Brian

For your information, AES (with MagiC5) return 3.99 as AES-version too ;-)

The originally mentioned approach is precisely the reason why Andreas Kromke still could not increase the AES version number beyond 4.0, even though MagiC AES has lots of improvements compared to AES 4.x. MagiC AES lacks a few minor things, and because egg-heads think the AES version number tells them everything about what is there, a MagiC returning 4.x as a version number would not run programs by those people properly. If everybody used the proper method by calling appl_getinfo then MagiC AES could have an appropriate version number that is proportional to it's quality, or service, or whatever, probably 6.0 or 7.0 ;-)

The method you suggest here to find out about appl_getinfo's presence is not appropriate either. It's again checking version numbers, which - I say it again - is not the right way. You noticed the problem already : appl_getinfo is claimed to be there with AES 4.x and later, but MagiC AES has version 3.99 and yet has appl_getinfo.

The only proper way to find out if appl_getinfo is present, is calling appl_find ("?AGI"); this returns 0 instead of -1 if appl_getinfo is present. After this, all AES extra features should be found out via appl_getinfo ! And voila : You do not need the version number anymore.

Cheers Peter

Well, depends what you're a newbie on. If you're a newbie on programming, then you should refrain of trying to use any graphics features from the operating system, just going for text based programs. That saves you the trouble of bothering with 80 % of all those calls. Once you know the basics of programming well, you can move on.

If you're a firm programmer, just not knowing the Ataris operating system, then go first for the lower parts of it, that is all but the GEM part. Explore BIOS, XBIOS and GEMDOS, that will give you a decent number of system calls to start with and to which you can get used. Then move on to GEM programming (VDI and AES).

I agree for a newbie the operating system provides a vast number of calls, but it is exactly this what makes it flexible and powerful. If you think there aren't needed so many, ask an Xwindow programmer. Only for the graphics part of the operating system he must deal with five times as many calls !

> Are the small programs I can start with so I can get familiar with the

I'm not sure what you're talking about.

> Now I was wondering if there are any know standards in programming the
> Atari. Or do I have to find all possible libraries on the net and put them
> together to find out which functions are best to use?

As an english reference the Atari Compendium is a good choice. This is not a tutorial, however. For this, Tim Orens document "Professional GEM" can be recommended. It's quite good, however a little out-dated, so everything you read from the PROGEM document you should compare with the appropriate part from the Compendium. Reading both at the same time you'll get a fairly comprehensive picture of programming Ataris. PROGEM can be found on the net on many ftp-servers, and BBSs, to be printed, the Compendium is available from book stores. Proceed reading this newsgroup and you'll learn about the more recent aspects of Atari programming.

Cheers Peter

Oh noooo ! It's so buggy like all those early c compilers. It's
successor, the Laser C is not much better in that.

I'd suggest you go for some recent compiler. Turbo C was the first good
compiler. It's successor, Pure C is even better, and damn fast. If you
got the resources GNU C is a good choice too, and provides the C++
extensions, however compiling is slow. I heard late versions of Lattice
C are rather good too.

> really afford to buy any books on the subject)

The TEDINFO structure has three entries, te_ptmplt, te_pvalid, and
te_ptext, that are responsible for the strings. The te_ptmplt is a template
that shows the structure of the edit field, where in fact characters can
be edited on the screen. Fixed characters are here, and underscores show
where the user can edit a character. The fixed characters are omitted in
both te_pvalid and te_ptext, there are places only for the editable
characters ! The te_pvalid determines what sort of characters are allowed

at the corresponding place. A '9' for instance allows only digits. The te_ptext contains the edited characters. This is the entry which is of most interest here.

A good example is what I had the other day when working on STiK :
An edit field for an IP address was needed. An IP address is four numbers between 0 and 255, separated by dots. The TEDINFO strings are :

```
te_ptmplt   :   "IP Address : ___.___.___.___"
te_pvalid   :   "999999999999"
te_ptext    :   "@__________"
```

You'll see the structure from the te_ptmplt. The underscores are the places the cursor may roam about. For each of the underscores there is a character in both te_pvalid and te_ptext : The character in te_pvalid (`9') means only digits are allowed (as numbers are to be entered). The te_ptext holds the finally entered characters. The `@' in the first position of the te_ptext is a trick to have the field cleared and the cursor in the first position when calling form_do, for instance.

Now form_do does all the work, and you only need to evaluate the te_ptext string.

Cheers Peter

Don't do this. Although I'm confident that MagiC will survive it, you'll
want your program work with other AES too if they provide the same
radio/checkbox feature. It's so little work to put in a pointer that
points to a $0 byte, indicating an empty string.

Cheers Peter

There is a minor thing to distinguish which might have caused confusion here. If you Pexec another program then GEMDOS knows that you (as a process) want to start another process. This other process will be your child then.

With shel_write things are slightly different. It is not your program that starts another process, and it's not the desktop either. In fact, your program asks the AES to launch the new process ! The AES do it, and thus the new process is a child of the AES. This means that the new process is not terminated if your process terminates, as you observed. However, the new process will be terminated by force if the AES terminate ! Sure this is not possible with MagiC, but there are several AES that can run with MiNT, for instance, and that can very well terminate. Those AES are Geneva, NAES, XaAES, oAESis ...

With MagiC or MiNT you're not necessarily stuck when launching another process using Pexec.

I guess what I wrote above clears up your confusion.

Yep, and all the information required is provided by appl_getinfo.

Cheers Peter

In the mid-80's when Atari was using the slogan "Power without the Price"
It was true. You couldn't buy a better system for the money. The problem
is that the prices on Atari hardware became stagnant, while hardware prices in

the PC world dropped rapidly. For instance, in 1992 Atari released the Falcon '030 (1 meg, no HD) for $799. Today toad is still selling the MK-I falcons with the same specs for... $799. In 1992, $799 might have bought you a 286 or 386 system with 1meg and a small HD if you were lucky. Now you can buy a low-end Pentium-class machine with 16meg RAM and a 850meg (or better) HD.

Add-ons are similar. For over $150, you can take your 8mhz ST to 16mhz with an Adspeed. For about $50 you can replace a 66mhz 486DX2 with a 133Mhz 5x86 CPU on a PC.

I would love to have an Atari clone that was as powerful as my PC (like one of those
Medusas or Hades machines) But at $3500 for what is equivalent to a slower Pentium at best, I just can't afford it. :(

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time, however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments. I believe there is a version of BASIC called STOS available for free download.

x-admin: news@aol.com

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!

----Robert Dupuy

EXTRA CREDIT

OK, you may add comments to any program by using the following format:

/* put comments here */

Got that? You type (without the quotes) "/*" to start a comment and a "*/" to end the comment.

The "/*" tells the compiler to ignore all text and the "*/" tells the compiler to stop ignoring text. Comments don't change the way your final

program runs or the size of your final program in anyway, but they are usefull for making your long programs readable by other programmers or yourself. Here is the first.c, this time with comments

```
/*
This is my very first program
*/

#include <stdio.h>  /* This is a header file.  Header file's have the '.h'
extension */

/* Every C program has a function called 'Main' */

main() {
         printf("My first program\n");  /*print my first program */
         getchar();  /* Wait for return */
              }
```

Of course in real life, you would not use this many comments. Comments that only state the obvious detract from readability and our goal is to make our code as readable as possible!

OK, compile this program, its exactly the same as the first! See, I told you....

Thats it for lesson one, in the next lesson we'll go over the format of C programs and what functions are all about.

p.s. always remember to end a comment with the '*/' . Its a common mistake to just start a new line without ending the comment. The compiler ignores all text untill it reaches a '*/' so if you leave one out, the compiler will ignore the rest of the program

Hi Folks.

I was wondering if any of you good Atarians have any experience of programming the 'Atari Way' using Magic PC. The reason I ask is that

I've just got a PC, and unfortunately haven't got room for the old ST any more. If I absolutely MUST, I'll keep it, but only if some of my ST software won't run under Magic on the PC.

The software I'm interested in (for programming anyway) is :-

Lattive C 5.52
Personal Pascal 2.05 (using Everest as the editor)

FYI, I have been using these systems under Magic 2 and Ease 3 for a while, and although Lattice has some compatibility issues that I have come across (eg running Batcher from the Lattice editor), it seems to work OK.

Look forward to your reply's !

Cheers,

Drew ;^)

LESSON ONE - Get To Know Your Compiler.

If you'll recall from the introduction, the compiler is central to making a C application. The compiler translates the english-like syntax of your program into a binary (1's and 0's) that the computer can execute.
In addition, since most C programs are broken into several segments, the compiler will link these segments together and will do some rudimentary

error checking.

There are two types of compilers available: those that use and IDE (integrated development environment) and command line compilers. Megamax LaserC (which is the primary compiler for this tutorial) is a good example of an IDE compiler. In an IDE environment, the editor (used for typing in the C programs) and other functions are built in a easy to use shell. Command line compilers tend to be a little more cryptic. With a command line compiler you use any text editor or word processor to write your code. Error checking is harder to do with command line compilers, and you may have to learn and understand how to use scripts to keep track of various modules. Alcyon C that comes with the Atari Developers Kit is an example of a command line compiler. I highly recommend that you do not use a command line compiler to learn C.

The goal of this lesson is to familiarize yourself with how your compiler works and you will type in your first C program. It will not be necessary to understand this program, only to type it in EXACTLY as written, and to compile it.

First, if you have not done so already install Laser C. (or whatever compiler you are using). Refer to your documentation for help. If you still cannot install your compiler then post to this group and someone will help you out.

Double click on the Laser C icon. This will load the Shell and ram resident programs. If you will be using a command line compiler then load a text editor. Select the File menu, then select New. In the window type the following EXACTLY (case is important):

```
#include <stdio.h>

main() {
        printf("My first program\n");
        getchar();
             }
```

OK, now select the file menu again, and then select Save As. Save this file as First.C....

The file should now be saved to disk, you may change the name but be sure that it has the ".C" extension, this is necessary for your compiler to recognize it as a C program.. In Laser C, you may now pull down the Execute menu and select run. If you did not type any errors then Laser C will automatically compile and run the program. Hit return to exit the program. Now exit Laser C, you will find a program called First.prg on your disk. You may run the program again, if you'd like, just double click on it! (Remember to hit return to exit this program)

If you are using a command line compiler, please refer to the documentation. Command line compilers usually work by typing the name of the compiler followed by the program you wish to compile. Also there may

be many options and several passes necessary to make them work. Please post to this group if you have questions about using your command line compiler.

>the "child" process until you exit it?

Not necessarily. I can only talk about MagiC here ...

There are two types of child. There's a child launched by Pexec() and a child launched by shel_write().

A Pexec() child will inherit the status of its parent but the parent is suspended. If the parent was multitasking then the child will do so, thus allowing other processes to continue. If the parent was singletasking then the child will do also.

A shel_write() child is brought up as a separate process. All processes remain running, including the parent. The only exception to this is application zero (typically your installed desktop). It is allowed to bring up processes singletasking. No other process can.

A singletasking process can spawn multitasking children.

So just about anything goes provided it does not interfere with other processes.

Hmm, I just found the manual is wrong. You have to set bit15 ob_state
not ob_flags *and* also mask WHITEBAK (0x40) into ob_state, which
means you'll have to set up a keyboard shortcut also.

>Can I set the ob_spec field of the G_BUTTON to a null pointer if I do not
>want any text to be drawn beside the radio button or check box? (I don't
>have MagiC myself, so I can't test this.)

I have never tried it because there is no way to do it in my resource
editor. I think you'd be better off with a nul (ie '\0') string, or a
string of spaces though.

>Also, how much room should I allow for the button? Under Geneva, for
>example, an extra three characters are taken up with the button, so the

>object must be made three characters wider than the text.

That should work with MagiC as well.

"ra" doesn't mean open for read and append it means open for read in Mode A.
Which means the file is read only and ASCII translation will take place.
The call is perfectly valid.

There's nothing wrong with "ra", it means "read in ASCII mode" whereas "rb"
is "read in binary mode". "ar" wouldn't work and isn't what you want.

Try making your filename static char[].

/* **
void ACCset(void);
void ACCreset(void);

There are certain functions which should not be called from an
accessory (after AES has been initialized):

Malloc(), Mxalloc(), Mfree(), Mshrink(), Fcreate(), Fopen(),
Fclose() or any stdlib function which uses these GEMDOS functions.

```
The reason is that single-tasking TOS will assign the resulting RAM
or files to the application, rather than the accessory, and will
free/close them when the application terminates.

This problem can be solved by bracketing the function call with the
ACCset() - ACCreset() functions:

  ACCset();
  p = Malloc(size);
  ACCreset();

If you call ACCset(), you MUST call ACCreset() before the next AES
call.  Do NOT call ACCreset() before ACCset() has been called.

No, "ra" not a perfectly valid mode string. K&R edition 2, knows only the modifier 'b' for binairy mode. The modifier 'a' for ASCII mode does not exist. It's something of Lattice C only I think, because it is in the Lattice C manual, but it's not in K&R 2 nor in Pure C. I tried to open a file with "ra" in pure C and it didn't work.

There is no need for the 'a' modifier to read in ASCII mode, because without a modifier a fopen() will always open a file in ASCII mode. There is also ModeA,

ModeB and default in the ANSI C standard. Default is ASCII and for binaire mode you have to use the 'b' modifier. So don't use the 'a' modifier in fopen if you want your C source to be compatible. (The integer _fmode doesn't exist too in ANSI C.)

Bye, Hans Wessels

You are quite right Mr Greenwood, STOS is the best BASIC on the Atari
for making games. I would argue that it has been since it's creation.

>That's nice, but I realy believe the honours will have to go to C. So will
>still have a lot of debating to do. :-)

How can C be the best BASIC ;)

> > But you went to great lengths telling us all how some ATARI computers

Surely this is a restriction in the hardware, not the software? Atari's
incompentance at making a non-fully compatible machine.

>No, I was telling you a programming language wasn't the best if it couldn't do
>all types of games for all types of computers. You don't dispute the fact that C
>can do GEM type of games. You do dispute if C can do fast arcade type of games
>like you do in STOS, so if I can prove you wrong too on that point, there is
>nothing left for STOS to be better at.

Erm... not being funny but I have yet to see a good GEM game, IMHO. I
feel it is easier to write a game in STOS then C. There are some STOS
commands which are so darned high level the programmer need do an
absolute minimum! I appreciate, however, that in C you can use libraries
which in effect offer high level programming.

>I think they will notice. Game players aren't THAT stupid. For me it's simply a
>part of showing C is faster than STOS.

Oh, a sweeping comment !!

>So? There are no falcons with half a meg. I will only load data I really need
>on the machine, and will only preshift sprites that are really needed. I can do
>the complete game in half a meg. It's simply a matter of allocating the memory
>you need and loading the data you need. More memory will be allocated when there
>is enhough memory and when it is needed for extra effects.

Go on then... do it ;)

>Maybe you didn't because detecting joystick, cursor youstick and joypad costs
>too much time?

The time, in STOS for joypad detection, is not noticeable.

> > Would like to see C make VidIgrid 2 hahahahaha

>What's VidIgrid 2? Does it run on my ST?

Oh boy, have you only a minimal connection with the Atari scene or
something? What's Vidigrid 2?? Hehehe, LOL!

>Why, it's clear, I am doing more lines in the same time, so the code has to be
>faster. It's better timed because the code is synced every vbl.

Whether is is faster in vbl's is irrelevant.. it is the playing that
matters. Maybe it will be too fast and impossible to control?

>Sorry, haven't seen diamond ice, but my game has actually more animation than

>and the new improved version.

In your opinion.. we'll have to see to compare..

>Well, you have to test it, but I think you will have to agree it's better.

> > although we would probably both have to show the actual source to
> > prove to anyone interested that only BASIC commands or only C
> > commands where used :)

>I have no problem releasing the C code.

BTW, don't you have a day job or something?! If only I could get time to
write a program just to see if it was faster than another!!

>So it's also impossible to get more than 3000 points? Just because you can't
>bear the thought someone is above you in the highscore list?

Oooh, handbags!!

I only joined this thread to see if I could be number 100 in it!!!! Like
I care about this arguement ;)

We all know that C and STOS are very different, STOS is better at games
and C is good for GEM applications. Real programmers use assembler...

In and out of this thread!!

Merry Christmas

I've looked at Toad's website. Yes, the prices are higher than you can get from a second-hand shop or a direct used sale. That's the nature of being a dealership--on used equipment sales, you can't compete with what somebody just dumping a machine will ask. Somebody just dumping a machine can't take your credit card and be a legal entity you can take recourse against if there's a major problem, either.

As for your statement about supply and demand, you can apply it to them just fine. Don't demand their machines and you're applying it. What's the problem there?

Nobody's asking you to be benevolent. If you think Toad's prices are too high there are other places to get the machines from. They're setting their margins, other people have their own. Personally, I think they're too high for me, so I'm counting on a sales post here to come through. But others may disagree.

Are you sure of this? It is certainly not true for K&R where there is
no way of explicitly defining ascii mode - it just defaults to it and
"a" does mean append. I'm beginning to wonder if ANSI rules are
different?

>I know I have used before...

There may be a K&R/ANSI incompatability issue here - again I can't be
certain. Here's the K&R version from my MWC manual which tends to

pride itself on being exact past the point of comprehension (you should see its description of strtok())!! Back to the point ...

```
r    read ascii, error if not found.
rb   ditto binary
w    write ascii, truncate if found, create if not found.
wb   ditto binary
a    append ascii, no truncation, create if not found.
ab   ditto binary.
rw   read/write ascii, no truncation, error if not found.
rwb  ditto binary.
wr   write/read ascii, truncate if found, create if not found.
wrb  ditto binary.
ar   append/read ascii, no truncation, create if not found.
arb  ditto binary.

r+   rw
w+   wr
a+   ar
```

"ra" equates to "r+" equates to "rw", and "rw" is the reason I think Lattice may have a bug. It should consistently fail _unless_ ANSI states differently. ;-)

```
>>>while the following code always works:
>>>
>>>strcpy(tempstring,cur_wind->filename);
>>>handle=fopen(tempstring,"ra");
>>
>>Does it start to fail if you manually delete the file?
>
>Yes, if the filename is invalid (ie. it doesn't exist) it fails with
>the (correct) EFILNF.
>
>>If I'm wrong then I've just typed a complete load of twaddle! :-))
>
>It does sound as if it is possibly correct... I'll give it a try. :)
```

I'd be interested to hear what you discover on this - bug or ansi feature.

The accessory will be the "active" process until it makes its first aes call (under standard gem) after which it may or may not be (it isn't but you can't be sure).

>I assume under a multitasking OS the two will be
>the same (when you read it), in which case you don't need to mess
>with it.

There is no guarantee (but it does seem to be) that what you have just read in the os header is anything at all under anything but standard gem. It would probably be best to look for specific operating system cookies?

TOS versions less than 1.4 do not have the information in the os header. You have to know the address where the basepage for the active process is stored. It is $602C for all versions except the spanish one which is $873C.

I've been working on a TSR that allows you to plug in extensions at boot
time.

These extensions allow you to have one system-wide piece of code to (for
example) translate bitmap graphics, edit on-disc data, and so forth.

So, the bitmap translator will be one library, the disc editor will be another, and so forth. And each library will reside in different executable files loaded at boot time.

Now, before I finalise things, I am interested to find out : what info would an extension need to know about at boot time? I already pass it info about the version of the TSR it will be plugging into, the CPU, FPU of the machine it is running on, TOS version, and which extensions are already loaded.

Before loading it, I have also checked that the extension has the correct magic id (so that I know it is an extension and not just a misplaced regular app), that it has a unique "cookie" and id number, and that CPU, FPU, and TOS are appropriate.

Is there anything obvious that I have forgotten to check for prior to extension loading time? Or to pass to the extension when it is loaded?

Oh, and while I am at it - if I happen to come across a second copy of an extension while loading, what should I do? My idea is to implement a "newer-is-better" policy, whereby the older version is "forgotten" and the newer version replaces it.

Your ideas, advice, guidance is welcomed.

Hans Wessels:

> When a 'b' folows after ony of the above symbols the file will be
> handled as a
> binairy file.

The attributes the file is opened for (ie either read,write or append) is always the first letter in the string and the mode always the second for example:

```
"a"     - Append in default mode.
"a+"    - Append and read in default mode.
"ra"    - Read in ascii mode.
"aa"    - Append in ascii mode.
"aa+"   - Append and read in ascii mode.
"ab"    - Append in binary mode.
```

There are other combinations but you get the picture.

Jr,

Oops, yes, maybe Tony doesn't want to include C anymore.

Ofcourse, you might find it a lot easier, Tony will, simply because he doesn't speak C. But C can produce better games as STOS basic. And when you know how to program in C writing a game isn't that hard. I wrote the C version of heartland in less then 10 days. Not bad for my very first game on the Atari ST. Ofcourse game concept was ready, I needed some time to get the graphics out of the original game and some extra time to figure out how their format is. A next game will be easier, because the keyboard handlers and music players are ready now.

>> Would like to see C make VidIgrid 2 hahahahaha

Well, I haven't seen much games last few years, Tony's statement attracted my attention so, heare I am, and no, I don't know anything about Vidigrid 2, and your comments weren't very helpfull either.

>> Why, it's clear, I am doing more lines in the same time, so the code

>> vbl.
>
> Whether is is faster in vbl's is irrelevant.. it is the playing that
> matters. Maybe it will be too fast and impossible to control?

Syncing to vbls is important on every atari that has more then 8 MHz, it ensures the game speed is the smae on all computers (exept for differences in the vertical frequency of the monitor).

> BTW, don't you have a day job or something?! If only I could get time
> to write a program just to see if it was faster than another!!

It didn't take too much time. I was simply a bit fed up with my normal programming work, so I did this game for fun (and to be right about C being faster ofcourse).

I believe you mean TOS 1.02. Yeah, I guess I should fix that.

So long as *prun contains the ACC's bpa, whether single-tasking or multi-tasking, nothing needs to be done. If multi-tasking, nothing needs to be done. If prun points to garbage (whether or not it is used), that OS deserves to crash.

Precisely what I suggested about a month back - excep you seem to have
refined the concept considerably.

As long as you have a compile date encoded in the extension (so you can
compare realistically), that seems like the smart way to go.

Power without the Price was Atari's idea for a slogan. And a load of Crap.
It defies logic and goes against All the Laws of the universe. Like "A Man
is worthy of His Hire." and "You get what you Pay for." and "If it sounds

too good to be true, It's probably a Lie." and in Atari's case, "You sow what you reap" aka "What goes around, comes around." Atari trying to appeal to cheapskates was it's undoing. Don't punish Toad because of an Atari Slogan. They're trying to support Atari, stay in business and feed their families. I just received a Toad-M SwitchBox which will let me use a MultiSync Monitor on my Atari ST to do Color and MonoChrome on the same MultiSync. This will also be the Last one Toad makes as their Technician is leaving because not enough people wanting to keep him Employed with a DEMAND for work. I know about the Crap that Bonafide Atari dealers put up with. And how many don't appreciate them. I blame it all on Atari, especially their slogan "Power without the Price!"

 NO!, You are correct, we agree C can do GEM , but I do not dispute
that C can do fast arcade type games, I could well agree that C can do
fast arcade games,
 To put simply, *IF* I could program in C and STOS, and wanted to make

a platform game then I would use STOS, there may be many tools that can do one specific job, but I would claim that STOS would be the BEST one to do that job, ie: my first choice, I also beleive that anyone else in the same situation would also use STOS, that is what it is for, that is the correct tool for the job and that would be top choice,
 I repeat I "could" agree C can do a platform game, but you have yet to show me one, you show me the game you say you have made, show me it using,
 A larger play area
 Better Sampled sound
 More Animation
 Better play area,

 In fact show me your game with everything better, then C will be better, but so far it is all talk,

>like you do in STOS, so if I can prove you wrong too on that point, there is
>nothing left for STOS to be better at.

 So show me ?.....you have spent a lot of time telling me you can do it, but shown me nothing ?, again I dont dispute your ability, I just want to see :)

> >> Yes, I have almost finished the conversion of Heartland to C. The
> >> screen is

> > You sneaky devil you :)

>I am?

 Well yes, you did not mention until nearly finished that you where doing this, so yes sneaky devil, BTW "sneaky devil" is a freindly expression :)

> > there is unused screen at the top,its an illusion and I know for a fact

> > simply thrown together, a lot of thought went into it

>I think they will notice. Game players aren't THAT stupid. For me it's simply a
>part of showing C is faster than STOS.

 No one suggested game players are stupid, I simply pointed out that a programmer can get away with a lot by using optical illusions, I mean surely thats what the whole concept is based on ?????

 Showing C is faster than STOS ? that would be a waste, no one is disputing the level of the language, its not speed, its ability, show me what C is capable of in game making, not how fast it is, I already know C is faster,

>It works on my two Atari's. (1Mb TOS 1.0 and a 4Mb Kaos TOS). But working on a
>TT is simply a matter of starting the game on a TT. I don't expect any trouble
>there.

 OK so the three or four game yearning TT owners out there will be
pleased :)
 But then, we havent seen yours working on ANYTHING yet?

> > this is far less noticable at 8 pixels, and its only a programmer
> > examining the game that would notice, believe me no one else has ?

>Or no one cared to complaim, all being happy to get a new game for their ST?

 You may be right, but I doubt it, no one is that desperate for a game
that they would then say its great, when its not?

> >> * It will work on a machine with 512kb or more memory
> >
> > NO!!! NOT IF YOU PUT EVERYTHING IN, you said you left half the game

>I will have to look for the extra STe and Falcon smaples. Up till now I only
>found one. (Thinking there was only one.)

 Whoops, the falcon enhanced samples are in Diamond Ice, Diamond Ice
came AFTER Heartland so obviously has improved routines... so you
would never make that on a half meg, no way :)

> > I can do jagpad easilly enough, just didnt, actually its very simply
> > to implement,

>Maybe you didn't because detecting joystick, cursor youstick and joypad costs
>too much time?

 It does not cost any time, it costs me going out and buying a pad,
its alright getting people to test certain aspects of a game, but some
you cannot trust to what people say, you have to see it for yourself
while programming or whatever, I only have a joystick so thats all its
programmed for, that simple really?,

> > Would like to see C make VidIgrid 2 hahahahaha
>
>What's VidIgrid 2? Does it run on my ST?

 Yes, it takes a Video, FLM or VID or whatever, cuts it up into chunks
and displays it back on screen like a jigsaw, you pick up a peice with
the mouse and drop it where you think it should be,the peice already
there then flicks to the empty slot you left, if you have seen ViGrid
on the JAGUAR CD then its a complete copy of that, but with obviouse
lilitations,
 There are 14 video clips on disk all cartoons edited to loop without
noticing where the loop occurs :)

sound simple ??
while you are moving a peice it is still playing the peice you are moving,as well as all the other peices individualy,
At later levels there are 30 peices of the video playing individualy,
When you pick up and move a playing peice, NONE of the video slows down :)

>there, the sprite will walk behind all objects like it does in your game. It's
>all the same, only a bit better. :-)

At this time, it is none existant,

>Sorry, haven't seen diamond ice, but my game has actually more animation than
>your Heartland, because the viewscreen is bigger, so there is more animation to
>be seen at the same time.

No I mean more items animated, where heartland had the coins, bottles and spikes, diamond ice has those and another 8 objects animated, like I say, later model, more advanced,

>They aren't the same, Heartland 2.0 is better, works on more machines, has an
>improved playing area. So there won't be two of the same, but the old version
>and the new improved version.

I hope you can show this soon, it is not nice of you to post public messages telling everyone how much better your version is, but not let anyone see it?

>Well, you have to test it, but I think you will have to agree it's better.

I would not count on it, I have yet to see it ?

> > although we would probably both have to show the actual source to
> > prove to anyone interested that only BASIC commands or only C

>Oops, yes, maybe Tony doesn't want to include C anymore.

His name is Martin, Mine is Tony, Please don't put words into my mouth :), Given the choice, I would use STOS BASIC before any other BASIC to make a game, and if I also had the choice of C then I would still choose STOS as it is better addapted for the job and therefore the better tool,
Hans, YOU! are then only person who disputes this, everyone else agrees, thus proving you to be in a miority of ONE!

>It didn't take too much time. I was simply a bit fed up with my normal
>programming work, so I did this game for fun (and to be right about C being
>faster ofcourse).

C being faster is not being disputed, C being the better choice for game making is the bone of contention here, I would not say STOS is faster than C, I cannot say STOS is more comapatable than C, (but apart from a couple of SUPER machines then its no less compatable) all I can say is that someone wanting to make a game that had all BASICS and C to choose from, then STOS BASIC would be the best choice at this moment in time, maybe not a couple of years ago, But now YES defintaly the best choice!

Naturally it would be trivial for the os to write the current bpa to
prun and as such it should be done by any future tos compatible os
also. As MiNT uses "proper" process identifiers it made me wonder if
it does actually update the bpa? It should ... ;-)

help Please !!!!!
I own an aAtari 1040 st That i have used for Midi Music for 8 years now and I would like to tranfer all my midi files from Atari machine format to Dos format .the only way i know to do this would be to send them via modem .the only hick i have with this is time since I have quite a few (100 or so and via 2400 bds it would take foerever)

A couple of years ago i received a diskette for drum samples that could be read on my Atari and on my Ibm all the files are .mid format ,if i save my files in .mid format on my Atari it cannot be read on My I.b.m.

My question is :is there another way to do this with a programm or something ?Any kind of help would be GREATLY APRECIATED.

Thanks in advance-Daniel

In 1988, the cheapest PC Clone available in my area was an (PB)
8Mhz, 8088, w/ 640k & 10Meg HD, dual 5.25 floppies and a cga card.

It cost $1000.

A 520ST (w/ SS drive) cost $300.

Despite the appearace that that Clone outspecs this ST, the
ST ran circles around that machine and was quite a bit more
useable.

Just because you can't manage it now; it doesn't mean that it
never was.

Power without the Price, existed once.

It is not a far stretch to say that that is why many of us are here.

No, "ra", "aa", "aa+" DO NOT EXIST in ANSI C. It's an extension of Lattice C on the Ansi standard. The problem is that they don't say the second 'a' is an extension of their own.

> choice,

There are two separate things:
1) If you have to program something the best language to do it in is the language you know best. In your case it would be STOS and I prefer C.
2) There is also a best languge to do some things. I think the best game language is the language that produces the best games, seen from the game players view. There it doesn't matter how hard the programming is, how ugly the interface to that language is or how unreadeble the source is. The only thing that matters is the result. (I am not saying that my source is unreadable, nor that my C compiler has an ugly interface, and I think we agree good coding is usually a hard job.)

> I repeat I "could" agree C can do a platform game, but you have yet
> to show me one, you show me the game you say you have made, show me

> A larger play area
> Better Sampled sound

Has the sample quality to do anything with the power of the language? Don't think so, DMA sound is DMA sound, a longer sample, or an higher sample rate only consumes more memory.

> More Animation
> Better play area,

That's also a matter of design, I think.

> So show me ?.....you have spent a lot of time telling me you can do
> it, but shown me nothing ?, again I dont dispute your ability, I just
> want to see :)

Well, a preview version of heartland is on it's way to you. I send it you via i_a, because the mail system on my atari doesn't allow to send me HUGE mails.

A short overview of the keys:
Esc: quit game
s: toggle sound: DMA sound -> chip sound -> sound effects only -> no sound
m: show map
r: show rasters (= processor time left)
h: toggle 50/60 Hz (very unwise to do on an 8MHz ST)
f: enable fast machine mode, it will play a nibble scrolled game on machines that are at least twice as fast as a normal 8MHz ST. (PS: My 20MHz turbo board ST isn't fast enhough, still has a 8MHz bus)
n: toggle nibble scrolling

Still to be added:
*Fix for jumping out of the game area in the right part of the game field.
*Detection of being dead, now you life can be negative, doing funny effects on the screen, maybe, if you wait long enough, the game will crash.
*Main menu screen
*Detection of game completion

Still to be tested:
*STe/Falcon/TT DMA sound
*STe/Falcon joypad
*TT/Falcon nibble scrolling (I realy wonder if a Falcon with VGA monitor is fast enhough for nibble scrolling)
*The walk right sprite sequence contains a damaged sprite (never had a correct version of the sprite data)
*working of the game on a half Meg machine (does anybody know the amount of free memory on such a system?)

The game is not intended for massive spreading yet, but you may give copies to people very intrested in the game. The game is only a preview.

> No one suggested game players are stupid, I simply pointed out that a
> programmer can get away with a lot by using optical illusions, I mean

> surely thats what the whole concept is based on ?????

Yes, but I think players will immediately see my version has a larger play area. You could call your version a mordern wide screen version. :-)

> But then, we havent seen yours working on ANYTHING yet?

Please tell me: did you receive the game and did you like it?

>> I will have to look for the extra STe and Falcon smaples. Up till now
>> I only found one. (Thinking there was only one.)
>
> Whoops, the falcon enhanced samples are in Diamond Ice, Diamond Ice
> came AFTER Heartland so obviously has improved routines... so you
> would never make that on a half meg, no way :)

Never say never, I may be tempted to convert that game too :-)
The amount of sound data isn't the problem, just don't load it if you haven't the memory for it. The only important thing is the amount of code and data needed for the main gameplay. All other things can be reloaded when needed. (Fastest access: put all data in one big file open it once at the game start and 'fseek' to the data position of the you need and load the stuff.

> It does not cost any time, it costs me going out and buying a pad,

Hmm, it does cost time to read the joypad, at least 8 clockcycles, but usually around the 100 cycles, so yes, time overhead of reading a joypad is very low.

>> Would like to see C make VidIgrid 2 hahahahaha

> At later levels there are 30 peices of the video playing individualy,
> When you pick up and move a playing peice, NONE of the video slows
> down :)

Yes, that's realy simple, it's no problem at all to do that in C, I think I can do it with a resolution 320x192, 240 16x16 pieces, movie going at 50 frames per second, 50 screen updates per second, all continues to play while ony pice is moving over the screen (including the pice you are moving). Just have the complete depacked sequence ready in memory, copy the current displayed part of the animation screen to the display memory (or change the screen adres when you are using a full screen puzzle, the piece moved is a sprited move over the

screen (can by done real time). When two pieces swap places update them in all screens and off you go. Where is the problem? Maybe the movie depackers, I haven't got them in my code collection, but no doubt they are available somewhere.

> >> Sorry, haven't seen diamond ice, but my game has actually more

> >
> > No I mean more items animated, where heartland had the coins, bottles
> > and spikes, diamond ice has those and another 8 objects animated,
> > like I say, later model, more advanced,

No problem at all. I can manage as many animated items as you like. The first thing geving problems is computer memory, because one 16x16 item costs 1kb in byte scrolling mode (2 kb for nibble scrolling). So if you want to have 512 items it's going to cost you half a Meg. You can put those items (or some groups of them) into an animation sequence. So a 4Mb machine can have about 3500 items that can be used in animations, allowing us to have 512kb of game code. The real problem is to find somone who will draw that many parts and put them together into nice animations. Your fantasy is the limit here, not the programming language.

Samething for the level map. Make it as big as you like, the biggest problem is to find someone who will design it, alter the macro's
(constants) MAP_LEN and MAP_HEIGHT in my C code and off you go, no problems with multiple overlapping maps like you did in heartland, just one big map. There is no 32k limit on the size of the map, nor on the seize of the item data. The only limit there is is the memory limit of the computer and, ofcourse, your fantasy.

> > I hope you can show this soon, it is not nice of you to post public
> > messages telling everyone how much better your version is, but not
> > let anyone see it?

Requests for the finished game can be send to:
mr_ni@mst.tn.utwente.nl
It's my e-mail adress at the university, allowing me to send huge amounts of data cheap and easy. You will receive a copy of heartland 2.0 as soon as I think it's completely finished (let's say before the end of January, writing a program isn't hard, making a complete product is!).

> >> Well, you have to test it, but I think you will have to agree it's
> >> better.
> >
> > I would not count on it, I have yet to see it ?

And now?

> > Just releasing the program is the problem hey ?
Yes, especially a finished and full debugged program, as soon as the code is working the fun is over, than the boring finishing starts.

> hahahahaha I wish you had put a smiley in the above, I really wish
> you had, Of course you can beat 3000, YOU have to see how,

Well, will have an other look. But I expect to find some extra bokkingen in your game. :-)

> Merry Christmas Hans <SMILE>

And a happy new year?

Although I am unsure about this, I seem to remember hearing somewhere that MagiC AES has its own inbuilt radio buttons and check boxes ("proper" ones that look like circles and crossed boxes respectively).

Since the MagiC programmer documentation is in German, it is difficult for me to use these features. Can someone explain how to use MagiC's radio butons and checkboxes (in English)? Thanks!

Also, how can I check for the presence of MagiC?

Any help would be appreciated.

Even under MagiC the launched program will be a child of the starting
process. This is sensible and necessary.

> calling application. I appreciate Andreas' comments of a while back that
> this is more sensible than Atari's mode 0 approach since it works to an

Why is functionality reduced ? Because others than MagiC's AES do not
bring preemptive multitasking ? That is not MagiC's fault.

> mind, Thing and Kobold being the most obvious.
>

You never thought of a MagiC version that one day will have an AES
version > 4.0 ?

I do not think this is sensible at all. But if you really need to make a distinction, please do it properly. Check for the MagiC cookie, or even better, call appl_getinfo to find out what works which way, instead of just comparing the AES version.

Cheers Peter

This would be proper action. But note that under preemptive multitasking the variable might not be the same anymore at the time of the Malloc. It's unlikely, but difficulties may arise. The way to go is to do the check and the Malloc in Supervisor context.

It's precisely like VDI drawing onto the screen. You only open a metafile workstation, instead of a screen workstation. You'll need META.SYS in your GEMSYS folder, or whatever it's called on your machine, and an entry in ASSIGN.SYS. Some special VDI calls then let you choose the filename, and write extra entries into the file.

Mfree and Fclose do not cause any harm, they may be called at any time.

This approach works with single-tasking TOS (i.e. original TOS versions without MiNT, MTOS AES or Geneva). With multi-tasking systems you'll cause problems here. So before using those ACCset and ACCreset calls you must inquire whether you're with multi-tasking, and thus whether you're allowed to use them.

 NO!, the thread is meant to be from a programmers point of view, that
is why it is posted in a programming group and not a gameplayers
group, so I am right when I say that a programmer, NOW who can program
in STOS and C, he should choose STOS to make a game, because that is
what it is for, If he can not program at all, but his interest is in
programming games then he should learn STOS,

>that matters is the result. (I am not saying that my source is unreadable, nor
>that my C compiler has an ugly interface, and I think we agree good coding is

> > surely thats what the whole concept is based on ?????

>Yes, but I think players will immediately see my version has a larger play
>area. You could call your version a mordern wide screen version. :-)

 of course they will....that is not the point, the point is that mine
has a smaller play area and no one noticed, no one complained and no
one said the game suffered because of a small play area, because you
cannot tell it is small, they do not realise, it is an illusion,
 Yes if you stick another version under there nose with a bigger play
are they will notice, but they havent got anothetr version, they have
heartland and like it, I realy do not see your point here, my point is
that the screen size is good enough and does the job, maybe a bigger
screen size will spoil the effect?, bigger and faster does not mean
better does it ?????

Ho dear, do you not understand the concept of a programming group, or the whole idea of a debate or discusion?, Yes the above was my belief, I am now saying that due to information since received, that if I am shown what Hans says he can produce then I would not say STOS is faster, better yes!, faster no :), this is what I get out of threads like this, knowledge and information,

>>and C to choose from, then STOS BASIC would be the best choice at this
>>moment in time, maybe not a couple of years ago, But now YES defintaly
>>the best choice!

>BTW: Is the hole thread a trick to influence some programmers to code
>   more games? ;-)

Very close, you are nearly right :)))
You see a lot of people have a very big missunderstanding about STOS, they see all the OLD games made years ago with the original STOS, these where terrible slow rubish type games that gave STOS a bad name, I released programs years ago that would be an absolout embarresment now, because STOS was so easy to use then everyone had a go and produced some total crap, (Including me)
Unfortunatly the Public Domain Libraries stupidly accepted these programs, gave them a great description and sold them,
Now all these years later, those same programs with the same descriptions can be bought from public domain libraries thus giving everyone the idea that STOS is crap,
But now STOS has been upgraded and can produce quality arcade type games that will stand up in todays market and will compare well with any other programming language, it is very hard to change peoples attitude, they think STOS=CRAP, they ignore wihout even testing software simply because they know it is STOS,

I have received emails from people who are amazed that STOS is capable of such software and are getting out there disks and having another go,

This thread IS having the desired effect and making some people realise that STOS is not as bad as it used to be,

Ask Hans and anyone else, what they used to think of STOS, and ask if they have changed there mind in the last couple of months,
If I lose this debate <grin> I will still win because STOS has a better name, I hope you have looked at something made recently in STOS and are not commenting on the STOS of old, thats the mistake a lot of people have made coming into this thread, they have gone away with there tail between there legs :))

Cheers.....!ynoT

>

For your information, AES (with MagiC4) return 3.99 as AES-version,
the "official way" is to check appl_getinfo() for testing new AES
feature (such as shel_write extension). But appl_getinfo() is available
with AES >=4.0 (MultiTos, Geneva, N.AES, Oaesis, Xaaes) execpet MagiC4.
Please, test AESversion >= 3.99 or
```
          AESversion >= 4.00 || get_cookie('MAGX')
```
and after, check appl_getinfo()

Doesn't count, only people who bother to respond to this tread count. I think most C coders see the header STOS and just skip. Maybe we should as MAUS.SYS.ATARI.SOFTWARE for their opinion. But determining which language is the best isn't a matter of majority. It can be proven that C beats STOS on any point that matters in game writing, so one person can be right and de rest of the universe can be wrong. Question is: are they willing to accept that, or will I be heretic and burned to death on the firestake? After all, earth is still turning around the sun. :-)

You did? Well, yes, from STOS point of view, STOS is best for making games because it's the only thing it can be used for. But that doesn't matter to this discussion, because we were comparing STOS with other languages and then STOS is way behind C, even on it's speciality: arcade games.

>> 2) There is also a best languge to do some things. I think the best

The end result counts? No!, the thread is meant to be from a programmers point of view, that.. etc etc. Well, for the first time in the thread you contradicted yourself between to quotations, congratulations!

Yes, you don't have to tell me basic is easier to learn than C, but if your intention is to write real cool games and you don't want to use assembley you have to use C for the best results, not STOS.

> You say you can make a better version of Heartland, I say you can
> not, are you saying you can make a faster version, but not better?
> what is the point of that, you must make a better version or say STOS
> is best.....

Well, by writing a faster game I proved C is at least on par with STOS on the arcade game type, taking all previous mentioned advantages of C in account, C is clearly the best.

> I meant bigger, to prove your routine is capable of the task, with no
> disk accesing during game play,

Do you think a mapsize of 320x200, or 640x100 will be big enhoug? I took these sizes because the complete map can't be displayed on screen when I am using bigger map size.

> bigger screen size will spoil the effect?, bigger and faster does not
> mean better does it ?????

Yep, maybe you are right, start using to old STOS routines again, the current allow you to show a too big screen and the game is also faster. In arcade games bigger and faster usually is better.

>> Hmm, it does cost time to read the joypad, at least 8 clockcycles, but
>> usually around the 100 cycles, so yes, time overhead of reading a

>> joypad is very low.
>
> you mean it takes MORE than reading a joystick ?

No, where did I say that? reading the joystick has to be done by a intterupt routine, or by sending IKBD command to the keyboard to request joystick data. Waiting for IKBD commands to be send takes really a lot of time. Intterupt routines take more time too. How much time does reading the normal joystick need in your oppinion?

Remember, we are talking about clockcycles, not scanlines, on a 8MHz ST one clockcycle is 125ns, a scanline is 512 clockcycles long, ie 64ms. At 50 Hz one screen is 160000 clock cycles. This information, plus a clockcycle table and some extra knowledge of bus usage during DE (display enable) allows you to create exactly synchronized screens, but that's assembly guru level stuff, but it can also done in (Omikron) basic or C.

>> Requests for the finished game can be send to:
>> mr_ni@mst.tn.utwente.nl
>
> yes request it, talk about it....but we still have not seen it?

It will be released. Please allow me some time to finish the product. It will be finished before februari 1997.

>> Well, will have an other look. But I expect to find some extra
>> bokkingen in
>
> "bokkingen" ?????

Yes, bokkingen. It's dutch. According to my dictionary has to be transleted in bloater, but that's no the type we are looking for :-)

So you happily moved the goal! First was STOS better because it could to blazing fast arcade games although it isn't as compatible as C is. Now STOS is better because STOS is better (#define BETTER STOS). It's nicer to write games in?... Let me summarize:

* C works on all Atari systems, STOS doesn't
* C produces working code for all Atari systems, STOS doesn't
* C will work on newer (not yet existing) TOS versions, STOS won't
* C can do GEM game, STOS can't
* C produces faster code than STOS
* C allows structured programming with functions and data structures, STOS doesn't
* C can be used for all kinds of programming, STOS can only do games
* C can produce it's own libraries (language extensions), STOS needs assembley to do that

Yet STOS is the best language to do games in? Get a life! STOS is nice to do games in, especially for unexperienced programmers, but it is certainly not the best language to do games in.

> This thread IS having the desired effect and making some people
> realise that STOS is not as bad as it used to be,

But still isn't as good as C always has been.

> Ask Hans and anyone else, what they used to think of STOS, and ask if

Hi there!

Mario Becroft (mbecroft@tos.ak.planet.gen.nz) wrote:
: Although I am unsure about this, I seem to remember hearing somewhere that
: MagiC AES has its own inbuilt radio buttons and check boxes ("proper" ones
: that look like circles and crossed boxes respectively).

It does, although I'm not really sure how to get at them. They may just
have to be called by creating a radio_button or check_box and calling it
extended type 13 or 14 with a resource editor...

: Also, how can I check for the presence of MagiC?

Check the TOS version number. It says 3.00 on my TOS 4.04 Falcon when
MagiC is running. It also tells me that I'm running AES version 3.99...

Not sure which cookie it is that says this, but I'm sure there is one...

Hi all,
I've been scooping around for 'c' and 'c++' compilers. And found Pure C, Borland C and GNU C++. But I've come to the
conclusion that there is no way for a newbie to start without spending hours,days or months on all the functions, bits and bytes for programming. Are the small programs I can start with so I can get familiar with the userunfriendly userinterface of all those C compilers? (There should be a combined interface with the resource editor and the GNU C++ with object library function.).
Now I was wondering if there are any know standards in programming the Atari. Or do I have to find all possible libraries on the net and put them together to find out which functions are best to use?

Also I was wondering if anybody has used the STL include files with GNU C++ compiler. For me the STL is the best thing since it's so darn smart coding. I will try to continue to use the STL header files with GNU. But the compiler might use to much memory so it might be neccesary to use virtual memory. (slow!)

Guess those were my 2 cents,
Fuse

>in?... Let me summarize:

What are you talking about ? I said that given the choice, STOS is
the best language to make games in 1996 compared to any other BASIC, I
then said that I would even add C, I never mentiond fast or
compatability, please do not trry to put words into my mouth,
I have since stated some things, but I have not moved the posts, my
original statment stands good, you have done nothing to prove it
otherwise, you make a gallant attempt and you do get me into corners
by talking a good debate,

But really at the end of the day we have to let the software do the
talking, mine has, your has not.....figure that one out :)

>* C works on all Atari systems, STOS doesn't

The only computers a STOS written game does not work on is the so
called supre computers, Hades and Madusa, I do not see that as a
compatability problem, so your compatability argument although true,
is pretty useless ?

>* C produces working code for all Atari systems, STOS doesn't

Is that not exactly the same point as above?, and I proved that to be

a useless point...

>* C will work on newer (not yet existing) TOS versions, STOS won't

 How the hell can you make a statement like that, that is impossible
to know, you are talking rubish here,

>* C can do GEM game, STOS can't

 I think that is a dissadvantage to C, thus you just shot yourself in
the foot,

>* C produces faster code than STOS

 Yawn, so what, how fast do you want to PRINT "SOMETHING"

>* C allows structured programming with functions and data structures,
> STOS doesn't

 So what, that has got to be the one most stupid statement you have
made, what point is there to that? you are right, but so what, I may
as well say STOS is better because it uses line numbers? you seem to
be scraping the bottom of the barrel for reasons here?

>* C can be used for all kinds of programming, STOS can only do games

 WRONG, See other posting for proof positive that your statement is
outlandishly ill-informed and to be honest, suprisingly cheap of you,

>* C can produce it's own libraries (language extensions), STOS needs
> assembley to do that

 eeerm again, so what? what is so good about that? it doesent seem to
do the C "games" programmer any good does it..

>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

 "Get a life", if you find my replies to you have taken a sour tint to
them, it is because you have taken to cheap insults like this, at no
point have I ever made a personal insult to you, even this message you
are quoting and replying to was not to you personally, yet you feel
the need to personally insult me, you tell me to "get a life" ?,

>games in, especially for unexperienced programmers, but it is
>certainly not the best language to do games in.

 Yes it is....you are wrong, but it is not enough to be wrong, today
you have to be childish and insulting, whats up, game not going to
plan hahahaha

> > This thread IS having the desired effect and making some people
> > realise that STOS is not as bad as it used to be,

>But still isn't as good as C always has been.

 I never said STOS was better than C, in fact I have made every effort
to say that C is better than STOS,
 But if someone wants to make a game, then STOS is the best choice,

> > Ask Hans and anyone else, what they used to think of STOS, and ask if
> > they have changed there mind in the last couple of months,

>Yes, it moved from total utter crap to could be sensible.

 How childish :(

 Please stop talking about how good you are, and start showing, I am
not going to have a debate with someone who resorts to childish
witterings and cheap insults.....Goodbye :(

Cheers.....!ynoT

 Well done Hans, you just ended this thread...thanks :))

>because it's the only thing it can be used for. But that doesn't matter to this

 WHAT!!!!!!! eh? what do you mean its the only thing it can be used for, we went through this once and I proved you wrong once,

 eg: there are more diskzines in the UK using a STOS written shell than any other,
 eg: The only multimedia displayer for a FM that allows text, animation, sampled sound, music, colourd text, choice of fonts etc in the one file is a STOS program

 And other peoples software, well how about Video Supreme? show me a rival to that, or how about grafix, both are COMMERCIAL programs, NOT games and are STOS, Education titles, STOS surely rules in that department, there are lots of instances of STOS in public domain and commercialy released software that are not games,

 You say STOS can only do games, ???? You are wrong again.....

>discussion, because we were comparing STOS with other languages and then STOS is
>way behind C, even on it's speciality: arcade games.

  So you keep saying, I proved STOS is better, and until you can prove otherwise then you are wrong, talk is cheap!

>intention is to write real cool games and you don't want to use assembley you
>have to use C for the best results, not STOS.

 again, I proved STOS is best, now you please stop talking and start proving...yes?

> > what is the point of that, you must make a better version or say STOS
> > is best.....

>Well, by writing a faster game I proved C is at least on par with STOS on the

 NO NO NO, you have talked about it, you have proved nothing, I showed you a good arcade style , fast smooth game, you have not showed me a arcade type game written in C, you just talked about it, that is NOT proof,

>allow you to show a too big screen and the game is also faster. In arcade games
>bigger and faster usually is better.

 In YOUR opinion...

> > you mean it takes MORE than reading a joystick ?
>
>No, where did I say that? reading the joystick has to be done by a intterupt

 You accused me of not adding Joypad support because the main loop could not handle the time, I say I already check for joystick, so in

the options screen someone chooses a jagpad then I simply swap a few
pointers and the routine looks for jagpad instead of joystick, same
time, no problem....so me not including jagpad was because I havent
got one to test with, and NOT because of proc time as you suggest,
your wrong again,

> >> Requests for the finished game can be send to:
> >> mr_ni@mst.tn.utwente.nl
> >
> > yes request it, talk about it....but we still have not seen it?
>
>It will be released. Please allow me some time to finish the product. It will
>be finished before februari 1997.

 So you get a couple of months brainwashing everyone by telling them
you can do it, you tell everyone its faster and better and you tell
everyone you have proved it,
 Why not wait until you have done it before you start telling everyone
how good you are ?

Cheers.....!ynoT

If ob_flags bit15 is set in a normal G_BUTTON then a toggle is drawn.
If the button is a radio button then a Mac style radio button will be
drawn instead. Normal Gem ignores this and displays the usual way.

>Also, how can I check for the presence of MagiC?

Look in the cookie jar for MAGX. It contains a pointer to the
MAGX_COOKIE structure which is defined in magx.h.

The Atari Compendium CD has all sorts of things, including some of the
more recent standards for GEM interfaces, etc. It also contains a lot
of associated source code and samples, as well as the docs on AES,
VDI, XBIOS, etc. I got mine for about $30 USD.

Hope this helps,
John

Sometime ago, I wrote a TSR which used the joystick to switch palettes based on which way the joystick is "pointed".

I recently tried to extend this into a joystick monitor (where the last X number of movements of the joystick are saved into a buffer, and can be called upon by the running ap)

Unfortunately, none of my implementations seem to be able to log the fire button.

The first time, I installed my code into the joyvec member of the IKBD structure. Whilst that will work for the standard UDLR motion of the joystick, it seems that the button is ignored (or is permanently set to "not pressed" by the time my code is run)

Next, I tried to put myself into the Keyboard ACIA data vector (using some code from a really old ST User mag). This is okay for UDLR, but when I look for any value other than UDLR, I am snookered. No fire button data seems to be available.

(In both cases, I am checking whether data bit 7 is set, signalling that the fire button is pressed)

How do I detect that the fire button is pressed, without disabling the keyboard?

(BTW: "UDLR" = "Up-Down-Left-Right")

I've never seen any rules on the parsing of the mode string but I've a
feeling "ra" is illegal as parsing is left to right. Try "ar".

>while the following code always works:
>
>strcpy(tempstring,cur_wind->filename);
>handle=fopen(tempstring,"ra");

Does it start to fail if you manually delete the file?

>anyone got any ideas why this is? is it a bug in
>lattice or something?

Assuming I've guessed right then it might be a bug or just one of the

undefined areas of C. Once a filing system error crops up it will
persist until cleared so it is perfectly possible the lattice fopen()
"mode string" parsing is doing something akin to the following where
fopen() is actually a function to test if a file of a given name can
be opened in a given mode ...

```
fp = fopen("foo","r"); /* fails, no file */
if OSERR == no_error THEN OSERR = status /* is EFILNF */
fp = fopen("foo","a"); /* succeeds, file created */
if OSERR == no_error THEN OSERR = status /* still EFILNF */
return (OSERR == no_error) ? fp : NULL /* oops lost the handle */
```

If I'm wrong then I've just typed a complete load of twaddle! :-))

>run as applications instead of ACC's.

If I can ever iron out the PATH problems vis-a-vis Geneva and Jetmail, I
would like to buy it and use it as my normal environment. So far, however,
I get errors when Jetmail starts - it keeps trying to look in C:\ for its
files, even though I created the GEM.CNF file as described in the Geneva
demo docs. As long asI can't get the demo to work properly with the
software I /must/ use, I don't want to spend the money for the full version.
'Twould be pointless to buy yet another program that I can't use (flashbacks
to Data Diet and the complete loss of partitions that it caused...).

I think Giacces should work in user mode. Going directly to the rigisters, like in the assembly example, works only in supervisor mode.
For you info: the bit you have to change is bit #6 in register 14 of the sounchip. The MSB is bit #7, the LSB is bit #0. Bit #6 set means speaker is on (according to the profibuch). You select a soundchip register by writing the register number as a byte at adres $ff8800. You can read the contents of the selected register by reading a byte at $ff8800. You can write new data in the selected register by writing a byte at $ff8802.

Hope this information will get you a working program.

Bye, Hans wessels

Well, to play with your rules: show me! This is type blah, blah, blah. I think it will be very hard to write a chess engine with STOS, because STOS has no functions. I think a chess program is the kind of program where data structures become handy and recursion will be used, so very bas points for STOS overhere.

>> with serveral GEM games. The only thing I didn't show is an arcade

Yes is the not so quick, but better answer.

> STOS is unrivaled in the catagories stated, ie: BASIC and C

Yes, I know, I don't know these people, you only know people playing games on harddisk less color systems.

> GEM made are fully compatable but can only handle board type games,
> where STOS can handle arcade AND board type games?

Gem type games are usually used as accessoire games. Games that are played when

the whole system is running, busy compiling a huge C project, or compressing big amounts of data (testruns typically require 15 minutes). I know, it's different from the use of an Atari you know.

> I still feel STOS would taking the above into consideration be the
> wisest choice, The only draw back STOS has is a slight compatability
> problem with SUPER comuters, the only drawback other BASICS and C
> have is they cannot manage anything that needs speed,timing and power,
> the choice is easy :)

Ah, I see, my demo is also a demonstration of bad timing and slow code? That was omikron basic, and I know I can do it even faster in C. How do you know you can't accomplish the speed of STOS in C? Ever seriously tried to write a game in C?

With C you can do ALL: GEM games, board games, arcade games, chess games, games running on super Atari's, games that have to be fast. The only better choice is assembley. No patching is needed to support a new TOS version. A second advantage is that C is easily upgraded with new functions, either written in C or assembley (or pascal, or fortran, or Modula 2, or ....). Any function or procedure that comes in a common object format like GST or DR (digital reaserch) format can be used with most C compilers. And when necessary, you can easily mix c and assembley functions in C.

I agree, you first have to learn to program in C, and the beginning isn't as easy as it is in basic. But when you are familiar with C you can do almost anything you want, write an OS, a text processor or a game, and that game can be faster than STOS games.

Why don't you see that much C games then? Well, I think there is an easy explanation for that too: to work confortable with C you need a harddisk. And harddisks are rare in your part of the Atari world. STOS basic seems to be less power hungry and is easier to learn, so more games are produced in STOS basic in your part of the Atari world (But this doesn't mean STOS is automaticly the best game language). I havent been in the gaming world for about four years, so I don't know much about recent games. However, I do know a lot about C compilers, the Omikrom basic compiler and how to write fast screen output routines (I still like to do some demo coding so now and then). So I still think it's possible to write a better arcade game in C then in STOS basic.

Bye, Hans Wessels

BTW Tony: who is stario land and why does it, well, you know...

Is "ra" an allowed combination? I think is't a bit strange to open a file for read and append, the proper call would be "r+" or is it a type for "rb"?

> while the following code always works:
>

I am sory, I have no explanation for this part. Maybe you could try to put cur_wind->filename into a char* and pass that to the fopen function? Just to see what happens?

So? The decision to use or not to use GEM can be made by the programmer. Being able to use GEM doesn't mean you HAVE to use GEM, but no GEM support means you can't use GEM, even if you want to. BTW: C was there at the birth of GEM.

> 2) Having to wait for GEM to load up - even worse if TOS was on disk
> :) (Non-GEM means able to be run from bootsector loader or auto-
> folder)

Still no reason not to support it. And STOS does need the OS, that's where the problems were comming from with TOS 1.04, 1.06, 2.06 etc. STOS uses a table to look up the OS routines for certain functions. On the old 520 with TOS on disk you have to load TOS before you can start something from the auto folder. At autofolder time BIOS, XBIOS and GEMDOS are installed.
The programmer has to choose which OS functions he will use:

* None means you can start the code from anywhere, you have to relocate your code and off you go. (Or it can even mean you are the OS.)
* BIOS, XBIOS and GEMDOS means you can start the program from the auto folder.
* AES and VDI can only be used when the whole system is initialized.

> 3) Booting the game on a clean system meant that compatibiltiy
> is *increased*

Meaning there are a lot of programs doing things not officially allowed for the sake of speed, but this does not mean a programming language shouldn't support 'clean' programming. A STOS game will always be incompatible because incompatibility is build into the programming language. It can be patched to

work on certain TOS versions, but the incompatibility will still be there.

> What other commercial games of that time run under GEM? Not many!

> keyboard! It was written in C and still can't get 100% compatibility. I
> don't think you can ensure 100% compatibility no matter what language
> you write in.

No, because you have to cope with TOS and it's bugs. But you have a good change being compatible by using GEM. Teradesk, my favourite GEM shell, runs AFAIK on all TOS versions and Atari like hardware. It's not a game, but it is an example of a program that is quite compatible, even First Word Plus of the stone age runs on the mordern systems I have been told.

> Look at the PC scene... most games are not designed to run under
> windows (a DOS shell in windows maybe - but then it's still under
> DOS)

Yes, in 320 x 200 in 256 colors because all higher resolutions won't work on all VGA cards, huge problems with Vesa support and secondly, PC's need a 66 MHz 486 and 8 Mb memory to do things a 8MHz 68000 with 0.5Mb memory could do ten years ago ;-).

> Even when coding in C or 680x0 I wouldn't choose to write arcade games
> in GEM - simply because it would be too slow!

I agree, going direct to the hardware is always (a lot) faster. And you can do it in C. You can do anything STOS can in C and even a lot more. That's why I think Tony is wrong claiming STOS to be the best language for games.

> Now can this thread die in peace?

No, then this newsgroup would be too silent. :-)

The Atari Programmer's User Group

It's that time of the month again...

ICTARI 41 is now available on my web-page. Go to:

http://www.elis.demon.co.uk/ictari/ictari.htm

Well, the last time I posted this message, saying that Pete Hibbs is about to step down as editor it generated exactly NO REPLIES. This is probably his second-last issue, and there's a chance that your's trully will take over. If your only contact with ICTARI is via my WEB-page then *please* send an article. You don't need to be any kind of expert, just read the note at the top of the page. I'm probably going to re-vamp the page in the new year, with some usefull links for programmers.

Have Fun,
"Augeas"

Hi all

I've been doing a bit of investigation into concurrent launching of
programs from within other applications and would like to make a plea
for a bit of cooperation from programmers.

If your program calls another program could you please test for AES >= 4
and use shel_write() mode 0 in that case rather than shel_write() mode
1. Mode 1 will only launch programs concurrently under MagiC. Under all
other systems (AFAIK) it launches programs as child processes of the
calling application. I appreciate Andreas' comments of a while back that
this is more sensible than Atari's mode 0 approach since it works to an
extent under all systems whereas mode 0 will crash most systems without
AES 4. However, functionality is reduced if your user is using a
multitasking system other than MagiC. A number of programs spring to
mind, Thing and Kobold being the most obvious.

It's not difficult to do, I've done it for the next version of
MultiPlicity so it can't be :-), and it's quite small:

If AES >= 4 then use shel_write() mode 0

else use shel_write() mode 1.

Regards
Martyn

g > How do I detect that the fire button is pressed, without
g > disabling the keyboard?

It would seem that the fire button does not trigger a joystick event. Try holding down the fire button while moving the joystick and see if you can detect that.

If true, there are only two ways to get fire button info while still using the keyboard.

1) reprogram the IKBD (EEEEEK!)

2) periodically request a joystick report (using a timer interrupt or VBI). You might have to switch to joystick interogation mode.

BTW, in joystick monitoring mode (which disables the keyboard), the fire button for joystick 0 is sent in bit 6 rather than 7.

The files are the demo listings, I have the files on my HD here,
uncompressed though. For a compressed version try : [ftp]

ftp.funet.fi/pub/atari/programming
The files you want are : 1-6.zoo 7-12.zoo 13-17.zoo
which contain the whole progem package

or

if that doesn't work try the attachment....

It must be something else both of these methods should work fine. Are you

sure you are using the correct structure referencer ie '->' or '.'? Are you including the correct header files for fopen you want <stdio.h>. Recheck your code, I assure you it'll be your fault and not the compilers :*)

Jr,

I'm having problems with Selectric and MiNT. Selectric doesn't work properly with MiNT sensitive programs which set Pdomain to 1 when MiNT is installed. Filenames are shown in lower case, then, and Selectric's mask patterns don't work anymore, even with `lower case' option switched one.

If there isn't a solution to the problem, what's the best alternative to Selectric?

Yes, it does. That also solves the file handle problem. I wouldn't use the
term "PID", though, since that's not what it is, technically. It's a
basepage pointer.

Note that you should NOT do this under MagiC, MiNT, or Geneva!

I am using Dr. Noonan's Epson Sylus driver for Pagestream. I have
noticed that with very large font sizes, the driver causes lines to print
across the page. I have watched closely over the past few months and what
seems to be happening is that the driver only prints a short section at a
time and, if the fonts are large, then it (somehow) prints the bottoms of

the letters at the top of this print section.

I wish I could explain this better. But, I have seen this many times and this seems to be what is happening. Only happens with big fonts and (for example) the the very bottom edge of a 72 point size letter "A" will print two short lines above the letter that correspond with the bottom of the letter. Weird. Has anyone else seen this? Any programmers with a Stylus willing to tackle this problem (or at least try to reproduce it? I love my Stylus but I have to always work around this problem.

Oh, it is version 2.0.5 and is called STYLUS_C.PRT. Bruse Noonan unfortunately is not upgrading it further. He has moved on to other things.

Toad's prices for used ST equipment are way too high, IMO. Last week, an Atari dealer offered me a NEW FALCON for $300 (albeit 1MB, no HD). Compare this with the $299 "special" Toad is offering on USED STe's. Also, a few days ago on this very group someone was selling a VERY nice TT for $300. I think people in this group ought to write to Toad and tell them that we are not willing to pay these prices! I know that Toad has long supported the Atari platform, but that is not an excuse to excercise price gouging. If you agree, write to Toad "Toaday" and let them know their prices are way off. I think the Atari community will be better off

with realistic prices set for equipment.

Yes, but it requires a 68881 coprocessor ;-)

You could also try writing C code then looking at the results with a
debugger (I do that a lot with Pure C).

I've not done anything with joysticks so all I can do is quote a
section which might be relevent.

[from page 341, Compute Tech Ref Vol 3, ISBN 0-87455-149-8] ...

"After any joystick command the IKBD reads both ports as if they have
joysticks attached with one of the buttons assigned to each. After any
mouse command (except mouse disable $12) the IKBD scans port 0 as if a
mouse were attached and "steals" the joystick 1 fire button line for
the right mouse button. In this condition the only way to read the
fire button on joystick 1 is to temporarily disable the mouse with
command $12. Then, the fire button on joystick 1 can be read until the
mouse is enabled again."

The above book has 30+ pages dedicated to the IKBD if you can find a
copy.

>both easier and quicker. Thoughts?

Wireframes will certainly be quicker but even the blitterless ST can drag a window plus its contents at a reasonable speed.

I've never had the need to fiddle with trap2 but it should be possible. There are three possibilities I think ...

a) Find a portable way of using the AES vdi handle and pretend to be the desktop. Without docs on the matter you may interfere with settings the desktop has in effect. The problem of implementing vdi calls within the trap is entirely yours of course!

b) Use the LineA. This will not affect the vdi at all due to the necessity of having to rewrite all variables for all calls (ie the vdi has to do this also). However, the linea should not really be used and use of it will almost certainly fail under some non standard situations (extended screen driver etc) where linea may not even exist.

c) Limit the feature to your own programs.

Another less obvious problem: you would have to ensure a multitasking system does not taskswitch midway through your code else the screen would be corrupted. This alone may limit you to (c) unless you can find a portable way of locking and unlocking the screen manager.

I do have some (I doubt all) of these source files lurking about
somewhere on floppies. If you can list the actual filename referencess
I can email the ones I have got. I have no idea where they came from
unfortunately!

Hi John,

I just wrote a key boardhandler, maybe it will help you a bit. The problem is this is just a level closer to the machine as you want do do your stuff, because I install myself in the ikbdsys vector and your joystick toutine has to work in the joyvec vector, but according to my documentation the information you want is pointed at by A0.

The programming language is C.

Bye, Hans Wessels

I suspect they're trying to liquidate their remaining inventory without
too much of a loss. Now that they're in the PC business, all that old
ST equipment is taking up room and costing money to store, heat, and
air-condition. If you mention prices, they'll probably come down.

I thought STeve Kipker's STeve's Atari Sales was the last Atari-only
bastion, but even STeve has been forced to go Macintosh. But he hasn't
made the intimations that he is dropping TOS support (like Toad has).

Hmm... I'm fairly sure that the a stands for 'ascii' not 'append' (I wrote
the original code with the lattice manuals in front of me. I wrote the
above code the day after from memory...) [ascii forces the conversions,
which I guess is probably the same as 'r', but its more obvious that it
isn't reading as binary]

yea, I'll try that (tempstring is defined as char[FMSIZE] btw)

aahh... thats possible... hmm.. except 'ra' is simular to 'rb' which
I know I have used before...

>>while the following code always works:
>>
>>strcpy(tempstring,cur_wind->filename);
>>handle=fopen(tempstring,"ra");
>
>Does it start to fail if you manually delete the file?

Yes, if the filename is invalid (ie. it doesn't exist) it fails with
the (correct) EFILNF.

>If I'm wrong then I've just typed a complete load of twaddle! :-))

It does sound as if it is possibly correct... I'll give it a try. :)

Cheers

We set our prices based on two basic principles: supply and demand. In our
experience the prices on that equipment are agreeable to the people who
buy it, hence their inclination to purchase.

With all due respect if you would like us to lower our prices, you will
need to either increase supply or decrease demand. :)

"Ambassador ," asked Steven. "Do you really want to know what's going on down there right now?"
"Yes, absolutely," replied gary@the-gap.demon.co.uk.
Steven moved forward, and whispered something.

```
 g>

 g> I'm very confused and I've looked at the MagiC5 documents.
```

Mode SHW_PARALLEL I believe.

```
 g> How can I launch a program (say CAB) from another program, AND leave
 g> the original program running?
 g>
 g> Magic5 doesn't support Pexec (load,go,don't wait).
```

I thought it did? Hmm lets take a look.

[fx: takes a look at MagiC docs]

Nope it appears not.

```
 g> Magic5 doesn't 'seem' to support mode 0 of shel_write.
```

No, it doesn't.

```
 g> Mode1 is no good because it doesn't launch the program until the
 g> calling program has exited. :(
```

Which is what is meant to do.

 g> Help!!! Does anyone have any idea how I can do this?

I think its shel_write(SHW_PARALLEL) #100, its detailed in one of the files in the magic 5 programming docs archive.

 g> I'm not interested in sharing memory or any of that stuff. Just a
 g> straightforward start another program.

What are you writing?

Has anyone got any information on bit 6 of $ffff8930 on the Falcon.

The only information I have is that it's set to zero (as below) but the audio app I'm working on at the moment (a new version of PlayAIFF) only works with bit six set.

$FFFF8930 [R/W] :$01 76543210 ..... Sound-Source-Device-Prescale-Mode Hi

```
                    ||||||||

Can anyone give me any information about the BlowUP FX.
We want to expand the Falcon. We also have several 1meg 30pin simms
lying around. With the BlowUp FX, can you use those one meg simms
to expand to 8megs? also, how much does it cost, is it hard to install
(I have some soldering experience).

Thanks,

George

I don't see why more dealers could not offer support for multiple
platforms like this. I totally understand that it's near impossible
to make a business stay afloat on Atari sales alone, but to carry it
as a side would seem to be a viable solution.

>Hmmmm, would it work to insert the ACC's PID into *(_syshdr->_run)
>before calling Malloc() then re-insert the application's PID?

Yes but it's not portable. It will only work under standard Gem and there's no guarantee it will work with a future version. MagiC for instance, allows you to Malloc() as and when you please because it treats accs like apps and switches appropriately.

d > Yes, it does. That also solves the file handle problem. I
d > wouldn't use the term "PID", though, since that's not what it
d > is, technically. It's a basepage pointer.

d> Note that you should NOT do this under MagiC, MiNT, or Geneva!

I planned to test the original value of *(_syshdr->_run) to see if it matched the ACC's BPA. (You have to read it anyway in order to restore it later.) I assume under a multitasking OS the two will be the same (when you read it), in which case you don't need to mess with it.

BTW, I think I picked up using "PID" for the basepage address from the MPB documentation, or maybe it was MiNT.

I thought about releasing source code for a bunch of ACCalloc() etc. functions, but would rather make them Pure C specific assembly code

so as to avoid calling the Malloc() etc. interface functions.

Anyway, I need to fix RAM_HOG.ACC

Why should I? I vote with my pocket book. I am not willing to pay those
prices, so I wont. Toad loses a customer. They have a right to ask whatever
they want for their Atari stuff.

: I know that Toad has
: long supported the Atari platform, but that is not an excuse to excercise
: price gouging. If you agree, write to Toad "Toaday" and let them know
: their prices are way off. I think the Atari community will be better off
: with realistic prices set for equipment.

I agree here. The Atari community should have realistic prices. Toad
doesn't have those realistic prices, so buy used. I have never understood
how Toad became THE name in Atari. I wont buy from 'em.

 To start programming something I have never attempted before? to make
a point? eeerm I think not :)

>it will be very hard to write a chess engine with STOS, because STOS has no

 Yes you are right, it would be very very hard I presume, but still
possible, I realy don't see why not?

> > therefore STOS is what? 90percent compatable, the only machines it
> > would fall down on are Hades and Madusa types, I dont think
> > complaints would come flooding in from those quarters?

>Yes, I know, I don't know these people, you only know people playing games on
>harddisk less color systems.

 The point being made is that the vast majority of game playing ATARI
owners will have access to ATARI ST Low? ,
 I don't see this as much of a disputable point, do you ?

>Gem type games are usually used as accessoire games. Games that are played when
>the whole system is running, busy compiling a huge C project, or compressing big
>amounts of data (testruns typically require 15 minutes). I know, it's different
>from the use of an Atari you know.

 Yes you are correct, multitasking of any description is something I
can only do with two machines running, however I think you are
stretching the point a little,
 Scenario: You know BASIC and you know C, you NOW! want to make a game
for the ATARI, do you attempt a gem game that would be a little bland
but works as a desk ACC and is pretty compatable?, or do you go all
out to make a game that people will be attracted to? , you can only do
so much with a desk acc, and most of this has already been done yes?
and the thread is the best BASIC for making a game today!

> > problem with SUPER comuters, the only drawback other BASICS and C
> > have is they cannot manage anything that needs speed,timing and power,
> > the choice is easy :)

>Ah, I see, my demo is also a demonstration of bad timing and slow code? That

 Your demo is just that, a demo, NOT a game, alright you will say it
can be changed into a game, I doubt that very much, the only part that
looks like a game is the menu, and sorry but even that does not
function very well does it, so if it doesent even work as a good menu,
what chance a full game ?

>was omikron basic, and I know I can do it even faster in C. How do you know you
>can't accomplish the speed of STOS in C? Ever seriously tried to write a game in
>C?

 aha!!!!!!! you are now getting to the point :), I am a STOS coder,

YOU are the C coder, I have shown you mine, it is up to you to show me
yours!, it is not up to me to show you how fast C is, I can write
nothing in C, what do you think this thread is far, it is for me to
say STOS is best, you prove me wrong, not me prove me wrong <smile>

>With C you can do ALL: GEM games, board games, arcade games, chess games, games

 I do not dispute any of the above, but if you could use C and BASIC
and STOS BASIC, then STOS would IMHO and many others? be the best
choice today to attempt to make a game,

>running on super Atari's, games that have to be fast. The only better choice is
>assembley. No patching is needed to support a new TOS version. A second

 I do not dispute that, but we are not talking about best language,
thats for others to squabble over, I am talking about someone
attempting to make a game today, with the choice of BASIC or C,

>advantage is that C is easily upgraded with new functions, either written in C
>or assembley (or pascal, or fortran, or Modula 2, or ....). Any function or

 Yes I know, but that is not proof that it is good for games?

>procedure that comes in a common object format like GST or DR (digital reaserch)
>format can be used with most C compilers. And when necessary, you can easily mix
>c and assembley functions in C.

 so? still doesn't win any debates does it?

>I agree, you first have to learn to program in C, and the beginning isn't as
>easy as it is in basic. But when you are familiar with C you can do almost
>anything you want, write an OS, a text processor or a game, and that game can be
>faster than STOS games.

 yawn.....the point is, would anyone?, thats the thread, thats the
question,

>like to do some demo coding so now and then). So I still think it's possible to
>write a better arcade game in C then in STOS basic.

 Want to put it to the test ?

>BTW Tony: who is stario land and why does it, well, you know...

 hmmm don't know where you got this from :), but it is true, I have a
very LOW estimation of STARIOLAND, I took one look at this slooow
boring and very bland platform game, took one look at the 20ukp price
tag and thought hey!, I can do better for free :))), ten years ago ok,
but chrging such a high price in the current market for such a drab
game is a bit of a *** *** IMHO :)
 hmmm this does beg the question what it is written in ?

Cheers.....!ynoT

I have the code on my web page for playing a midi file, but this only
works for MIE3, I beleive there is another command to get it working
on Netscape, anyone know what it is?

Cheers.....!ynoT

> obvious that it isn't reading as binary]

I checked the Lattice C (5.0) manual for it, and I must admid, the description overthere is a bit fuzzy, but K&R (2nd edition) page 242 is quite clear:
"r" open texstfile for reading
"w" create textfile for writing
"a" append, open or create a textfile to write at the end
"r+" open textfile for update (read and write)
"w+" create textfile for update, delete the existing one
"a+" appen, open or create a textfile for update, with writing at the end

When a 'b' folows after ony of the above symbols the file will be handled as a binairy file.

So a file is always opened as an ascii file unless 'b' is used to force it into a binairy file.

Linux/m68k doesn't require a built-in MMU, just a m68k processor with an MMU; a 020+8851 will work.

The original poster should note, however, the wording of the FAQ (namely "There is *no way* to run it without one"); i.e. there is no way around this. You need a better processor than a 68000.

From the Linux/m68k FAQ[1] :-

"2.1 Processor

 You need a Motorola 680x0 processor *with PMMU*. There is *no way* to

run it without one. This reduces the list of possible processors to
68020+68851, 68030, 68040, 68LC040, 68060."

I will do a blazing fast non GEM game, requiering ST LOW.

You think heartland is the best you can do in STOS (given the game type?)?

>
> Want to put it to the test ?

Yes, I have almost finished the conversion of Heartland to C. The screen is
moving, the sprite works (still have trouble with the right sequence of sprites
when rotating the sprrite clockwise and anti clockwise). It doesn't have any of

the card- and teleport animations but I think that isn't essential for the game play, and the prove the game game be done better and faster in C.

But:
* It's faster than STOS basic, my C version has a playfield of 160 scanlines instead of the 128 you do with STOS basic.
* It will work on ST, Ste, TT and Falcon
* It has IMHO better sprite handling routines, it won't fall down from a platform that quick.
* It will work on a machine with 512kb or more memory
* It will play chip music on an ST and DMA music on STe and better
* Support of cursor joystick, normal joystick and joypad
* On fast machines (like TT and Falcon) the game will switch to 1VBL mode and scroll on nibble level.
* It is fully synced, so on accelerated ST's it will always run in 2 vbls, no matter how fast your ST is. But you can switch to the fast machine mode by pressing a key.
* The whole game is writen in C, according to the rules.

The game is also faster, more compatible and better timed...

To say it in chess terms check! mmmmma... :-)

Still have a question...

As the whole game design is yours I can't release the game in the public domain. So I donate it to you. You can release the game if you want (as heartland 2.0 or something like that). If you want to release the game as heartland 2.0 we have to spend some time making the game like yours, including card animations and teleport effects, game loading and saving and so on. If you don't want to release the game I simply send you a finished version without save routine and intro picture nad so on.

So, what are we going to do with the game? (I think will have it finished it tuesday).

A bugg report of your game (it's in mine too):
If you go to the most right part of the game map and from there up, to the point where you can go back to the rest of the game you will come to a point you can jump up into a wall, it looks something like this:

```
                  X
                  X < wall
   platform       X
===================X
   X
   X
   X   platform    S < sprite
   X=====================================
```

When you continue to jump up in the wall the game will crash.

Further I still haven't found out how to reach the three coins close to the boy image in the wall, right of the big slide and those coins located high in the game map (these are the same a I asked you about some time ago).

  >
 >> BTW Tony: who is stario land and why does it, well, you know...
 >
 > hmmm don't know where you got this from :), but it is true, I have a

I wrote this when I just had the routines for displaying the map working.

>Hi there, all of you, the thread is going to end...
>It's 11 days before the end of 1996. So time is almost over.

 And me being ME will then state STOS is the best BASIC for making games in 1997, and all the members of the knitting classes who lurk in here will have releative Heart attacks :))

> > for the ATARI, do you attempt a gem game that would be a little bland
> > but works as a desk ACC and is pretty compatable?, or do you go all
> > out to make a game that people will be attracted to?

>I will do a blazing fast non GEM game, requiering ST LOW.

 But you went to great lengths telling us all how some ATARI computers cannot use ST Low thus making any game that does not support other resolutions inferior, you seemed to be saying that so long as it worked on every machine then it was the best, hmm even if the game was

naff?

> > YOU are the C coder, I have shown you mine, it is up to you to show

>OK, I will :-)

 eh?...you will hehehehe

> > say STOS is best, you prove me wrong, not me prove me wrong <smile>

>You think heartland is the best you can do in STOS (given the game type?)?

 NO, thats a BIG NOOOO, not only is it not the best STOS can do, but
there are other STOS programmers around,
 I am currently loking at making a game that will have same scrolling
etc, but plenty of independant baddies, that will be uncontrolled, ie:
no set left/right paths, also a still background screen, then when the
platforms move it gives a spooky parralax effect , and a few other
ideas,
 However I must stress that these are as yet only working individual
routines, yet to be all plonked into a game <?> yikes :)

>Well, the choice to get the best, and fastest game is C!

 So you keep saying?

> > Yes I know, but that is not proof that it is good for games?

>No, it is not.

 hmm your being agreeable...I sense a trap ;-)

> >> game, and that game can be faster than STOS games.

> > yawn.....the point is, would anyone?, thats the thread, thats the
> > question,

 You will? oooer

> > Want to put it to the test ?

>Yes, I have almost finished the conversion of Heartland to C. The screen is

 You sneaky devil you :)

>moving, the sprite works (still have trouble with the right sequence of sprites

>when rotating the sprrite clockwise and anti clockwise). It doesn't have any of
>the card- and teleport animations but I think that isn't essential for the game
>play, and the prove the game game be done better and faster in C.

heres a point?, waddaya mean "faster", if you mean more proc time
left then put something else in and then it will be better,

>* It's faster than STOS basic, my C version has a playfield of 160 scanlines
>instead of the 128 you do with STOS basic.

I doubt a game player would notice, I set the heartland screen out in
such a way that it hopefully gave the illusion that it started from
the top of the screen, not to a fellow programmer, but to a game
player, and most people at first glance, you would not know that there
is unused screen at the top,its an illusion and I know for a fact that
it works to a certain extent, believe me the screen was not simply
thrown together, a lot of thought went into it

>* It will work on ST, Ste, TT and Falcon

Ok TT would beat me, but thats IF you manage it, so far yours works
on NOTHING yet ?

>* It has IMHO better sprite handling routines, it won't fall down from a
>platform that quick.

hehehe, alright I was sloow but I figured out the part you where
attacking, you originaly gave the impresion that the sprite hung over
the edges of platforms, or fell through platforms, (IT DOES NEITHER)
but what it does do is scroll the screen at 8 pixels, but for simple
sprite detection I force two moves, thus only having to do 16pixels
sprite detection, as the play area is made up of 16x16 bloacks then
all i have to do is keep track of which block is where?
changing two variable and you can have the same game moving at 4,2 or
1 pixels,
for example if you set to one pixel scrolling, then you move left,
the screen will move one pixel, but will move 16 times before you get
control again,
this is far less noticable at 8 pixels, and its only a programmer
examining the game that would notice, believe me no one else has ?

>* It will work on a machine with 512kb or more memory

NO!!! NOT IF YOU PUT EVERYTHING IN, you said you left half the game
out because it was not needed to prove the speed point, if you had put
it all in then you either have a lot of disk access, or you go over
half a meg, that was a little cheeky of you to try and sneak "half
meg" in, you could not make the SAME game in half a meg, noooooo way,
the falcon sample is over quarter of a meg for a start!!
If I was to take most of the stuff out like you have then I could do
half meg,

>* It will play chip music on an ST and DMA music on STe and better

Mine already does that, but even more enhanced sound if ste has more
than one meg or a falcon is detected,

>* Support of cursor joystick, normal joystick and joypad

I can do jagpad easilly enough, just didnt, actually its very simply
to implement,

>* On fast machines (like TT and Falcon) the game will switch to 1VBL mode and
>scroll on nibble level.

Yeagh, ? I will be impressed, if I see it :)

>* It is fully synced, so on accelerated ST's it will always run in 2 vbls, no
>matter how fast your ST is. But you can switch to the fast machine mode by
>pressing a key.
>* The whole game is writen in C, according to the rules.

eeerm there wernt any rules, wish I knew we where having a compo, I
could have set to something C would be impossible to do,

Would like to see C make VidIgrid 2 hahahahaha

>The game is also faster, more compatible and better timed...

In Your Opinion....

>To say it in chess terms check! mmmmma... :-)

Hmmmm I think my King is safe, I cant even see your set? <smile>

will yours have the sprite walking behind all the objects mine does,
to be honest that was the killer punch in my game and the effect takes
half the proc time :(
I presume your game will be as big and have the animations, will it
have as much animation as diamond ice has?

I don't doubt your programming abilities Hans, but will be suprised
if you can duplicate Heartland in C, let alone the enhancements found
in diamond ice,

>Still have a question...

>As the whole game design is yours I can't release the game in the public
>domain. So I donate it to you. You can release the game if you want (as

No you should release it, the work will be yours and the public whome
the majority are FM and STe owners, can play the games side by side
and see which is best:)

>heartland 2.0 or something like that). If you want to release the game as

>heartland 2.0 we have to spend some time making the game like yours, including

 a unproductive task, no point having two of the same other than to
compare,

>card animations and teleport effects, game loading and saving and so on. If you
>don't want to release the game I simply send you a finished version without save
>routine and intro picture nad so on.

 as the work is yours then the decision is yours, I wont mind :)

>So, what are we going to do with the game? (I think will have it finished it
>tuesday).

 if it is anywhere as good as mine from a gameplayers point of view
then I will eat my words :)
 although we would probably both have to show the actual source to
prove to anyone interested that only BASIC commands or only C commands
where used :)

>A bugg report of your game (it's in mine too):
>If you go to the most right part of the game map and from there up, to the
>point where you can go back to the rest of the game you will come to a point you
>can jump up into a wall, it looks something like this:

 thats the design of the map, not the actual engine, no detection is
done in mine for what is above the sprite, the map was supposed to be
designed so the sprite could not reach anything above it that it
shouldnt,, obviously one part was designed wrong,

>Further I still haven't found out how to reach the three coins close to the boy
>image in the wall, right of the big slide and those coins located high in the
>game map (these are the same a I asked you about some time ago).

 Red Herring!, the sprite is there to attract, let you notice, a
simple look at the map should show that its impossible to get to them,

 NO its not a bug :), its a nasty bit of game play to make you work :)

 When I released SPOT IT, I knew it was hard, so I made it quite clear
there was a cheat, loads of people wrote asking where the cheat was as
they had tried everything to find it and couldn't, well there was NO
cheat, but trying to find it added to the game :)

 no one said you could get all the coins :)

 The ones at the top? well if i recall, you have to go through one of
the doors and you are transported there? I think ?

Cheers.....!ynoT

That's nice, but I realy believe the honours will have to go to C. So will
still have a lot of debating to do. :-)

> But you went to great lengths telling us all how some ATARI computers
> cannot use ST Low thus making any game that does not support other
> resolutions inferior, you seemed to be saying that so long as it
> worked on every machine then it was the best, hmm even if the game
> was naff?

No, I was telling you a programming language wasn't the best if it couldn't do
all types of games for all types of computers. You don't dispute the fact that C
can do GEM type of games. You do dispute if C can do fast arcade type of games
like you do in STOS, so if I can prove you wrong too on that point, there is

nothing left for STOS to be better at.

>> Yes, I have almost finished the conversion of Heartland to C. The
>> screen is

I am using the processor time left to display 32 lines of display extra.

>> * It's faster than STOS basic, my C version has a playfield of 160
>> scanlines instead of the 128 you do with STOS basic.
>
> I doubt a game player would notice, I set the heartland screen out in

> that it works to a certain extent, believe me the screen was not
> simply thrown together, a lot of thought went into it

I think they will notice. Game players aren't THAT stupid. For me it's simply a part of showing C is faster than STOS.

>> * It will work on ST, Ste, TT and Falcon
>
> Ok TT would beat me, but thats IF you manage it, so far yours works
> on NOTHING yet ?

It works on my two Atari's. (1Mb TOS 1.0 and a 4Mb Kaos TOS). But working on a TT is simply a matter of starting the game on a TT. I don't expect any trouble there.

>> * It has IMHO better sprite handling routines, it won't fall down from
>> a platform that quick.
>
> hehehe, alright I was sloow but I figured out the part you where

So I beat you there to, when you are on nibble scroll you can position your sprite on 4 pixels exactly, in byte scroll on 8 pixels. Further the sprite is nicly alinged with the field grid.

> this is far less noticable at 8 pixels, and its only a programmer
> examining the game that would notice, believe me no one else has ?

Or no one cared to complaim, all being happy to get a new game for their ST?

>> * It will work on a machine with 512kb or more memory

> "half meg" in, you could not make the SAME game in half a meg, noooooo
> way, the falcon sample is over quarter of a meg for a start!!

So? There are no falcons with half a meg. I will only load data I really need on the machine, and will only preshift sprites that are really needed. I can do the complete game in half a meg. It's simply a matter of allocating the memory you need and loading the data you need. More memory will be allocated when there is enhough memory and when it is needed for extra effects.

>> * It will play chip music on an ST and DMA music on STe and better
>
> Mine already does that, but even more enhanced sound if ste has more
> than one meg or a falcon is detected,

Your game doesn't play chip music. It only does when you hit upon a coin or touch a spike (and things like that). At that moment game speed will slow down to 3 vbls (talking about good timing here?). I can play chipmusic all the time an will still have a 2 vbl game.

I will have to look for the extra STe and Falcon smaples. Up till now I only found one. (Thinking there was only one.)

>> * Support of cursor joystick, normal joystick and joypad
>
> I can do jagpad easilly enough, just didnt, actually its very simply
> to implement,

Maybe you didn't because detecting joystick, cursor youstick and joypad costs too much time?

>> * On fast machines (like TT and Falcon) the game will switch to 1VBL

>> mode and scroll on nibble level.
>
> Yeagh, ? I will be impressed, if I see it :)

Will, quite simple, if the game runs in 2 vbls on an ST than it will run in 1 vbl or less on a comuter with a bus and processor twice as fast. The nibble scrolling will work because I tested it on my computer (still running in 2 vbls though).

>> * The whole game is writen in C, according to the rules.
>
> eeerm there wernt any rules, wish I knew we where having a compo, I
> could have set to something C would be impossible to do,

The rules are no assembley. If I was allowed to use assembly I could to the game full screen (I think, didn't check that out).

> Would like to see C make VidIgrid 2 hahahahaha

What's VidIgrid 2? Does it run on my ST?

>> The game is also faster, more compatible and better timed...
>
> In Your Opinion....

Why, it's clear, I am doing more lines in the same time, so the code has to be faster. It's better timed because the code is synced every vbl.

> will yours have the sprite walking behind all the objects mine does,
> to be honest that was the killer punch in my game and the effect
> takes half the proc time :(

Ofcourse, no problem on that point, it looks exactly like your game does, there is more to see, you have a better sprite control, but all animated sprites are there, the sprite will walk behind all objects like it does in your game. It's all the same, only a bit better. :-)

> I presume your game will be as big and have the animations, will it
> have as much animation as diamond ice has?

Sorry, haven't seen diamond ice, but my game has actually more animation than your Heartland, because the viewscreen is bigger, so there is more animation to be seen at the same time.

> I don't doubt your programming abilities Hans, but will be suprised
> if you can duplicate Heartland in C, let alone the enhancements found
> in diamond ice,

Heartland was no problem for C. I still have 2 lines of 20 16x16 sprites to spare before I am back on the same level as you, so I have some time left to do some extra animations if you like.

> No you should release it, the work will be yours and the public whome

> the majority are FM and STe owners, can play the games side by side

Ok, that's nice.

> a unproductive task, no point having two of the same other than to
> compare,

They aren't the same, Heartland 2.0 is better, works on more machines, has an improved playing area. So there won't be two of the same, but the old version and the new improved version.

>> So, what are we going to do with the game? (I think will have it
>> finished it tuesday).
>
> if it is anywhere as good as mine from a gameplayers point of view

Well, you have to test it, but I think you will have to agree it's better.

> although we would probably both have to show the actual source to
> prove to anyone interested that only BASIC commands or only C
> commands where used :)

I have no problem releasing the C code.

>

Yes, that's a programmers view. To an ordinary player is't a bug in the program because the computer suddenly terminates the execution of the game and goes back to the desktop without enabeling the mouse again.

>> Further I still haven't found out how to reach the three coins close

So it's also impossible to get more than 3000 points? Just because you can't bear the thought someone is above you in the highscore list?

> no one said you could get all the coins :)
>
> The ones at the top? well if i recall, you have to go through one of

None of them does so (if I recall it right).

Does anyone know how to save output as a metafile (or print it) when
programming under SozobonX C? Any help would be appreciated, email me
on afoster@zetnet.co.uk. Thanks!

> 60Hz makes a difference...

So the debate went the wrong way. We were trying to talk about the best game language and not the best arcade language for ST/Ste. And in a debate about a good game lamguage all types of Atari machines are allowed. Making games for all types of machines is a hard job, requireing a powerfull language. It seems to me STOS isn't powerfull enhough to do this. It's very nice Tony makes cool games with STOS for ST's, but that is not enhough to prove STOS is the best language for games. I had to emphasize the GEM part because that's STOS' the week point making it not the best language for games.

>> Why do you want to uninstall atari software? ;-)
>
> hehehe... well, maybe if it is to big/slow?

I think we are quite lucky here on the Atari platform. Most software can be un installed by simply trowing away the folder it's in. Windhoos software is totally different on this point...

> No, there is nothing false in the above. However, it makes slower
> machines redundant. There are FAR more ST's out there than Falcons,

> programming.

I am not advocating that all games should be GEM games, but merely that a language has to be able to generate GEM games if it wants the label "the best language for games".

Yes, I see your point. It's not limiting. Most things you call commands in basic are funtions in C. The small standard command set is enhough to do all programming with. I can't give a better explanation. Maybe you can compare it to someone fron China asking if only 26 different characters are very limiting for the english language.

> might prevent conflicts, but it doesn't seem to matter. Any ideas? I
> can post some assembly source here if the solution isn't obvious from
> this description. -- Mark

The drive- and side select of the diskdrive come from the soundchip. With:

```
    move  #$2700,SR              ; disable interupts

    move.b #$0E,$FFFF8800.w      ; select IO register A
    move.b #$00,$FFFF8802.w      ; Write 0 into the register

loop:
    bra.s  loop                  ; stay here forever
```

the drive leds of drive A and B are switched on, but as soon as you are starting your sound routine the drive leds will go out and you can't get them on again. (Try it, I am sure I am right on this point!). After you started you your soundchip routine the following things won't work anymore:
-drive a
-drive b
-the printer
-the serial port
-the speaker of a TT will not work

All these things are handled by I/O port A of the soundchip. Now what's your problem? When you are playing sound you will make use of register 7 of the soundchip (the Mix-Ctrl register). This register switches sound and noise on and of for all three channels, but also determines the direction of the I/O ports. When you set the 2 highest bits in this register to zero you switch the to I/O ports to input. when I/O A port is switched to input it can't send drive select to the drives and so on. The simplest way is to force the two bits to 1 (by or-ing with $C0), bet better is to set the bits in their original state. I recently patched a sound routine with this problem the following way:

```
save_registers:
;save all traps and hardware registers that are altered
; all registers are save to a space pointed at by A0

    move #$2700,SR
.....

; lots of registers are saved overhere
; and now for the soundchip bit:

    move.b   #$7,$ffff8800.w     ; mix ctrl
    move.b   $ffff8800.w,d0      ; get the register
    move.b   d0,(a0)+            ; save it
    and.b    #$C0,d0             ; get the two highest bits
    lsl.w    #8,d0               ; make it right for the play routine
    move.w   d0,io_modify_adr    ; modify some code
    move.b   #0E,$ffff8800.w     ; IO register
    move.b   $ffff8800.w,(a0)+   ; save IO register

....
; end of initialisation code

soundchip_music:                 ; the soundchip routine
    lea      $ffff8800.w,a6      ; use a6 as soundchip base
    movem.l  music_data(pc),D0-A4; the music data that has to go to
                                 ; the soundchip
    move.l   d0,(a6)             ; write d0 to the sounchip, in this
                                 ; routine d0 contains the data for
                                 ; soundchip register 0 and so on
    move.l   d1,(a6)
    move.l ...
    move.l   d6,(a6)             ; sounchip register 6
    and.w    #$3f00,d7           ; clear high bits for register 7
io_modify_adr equ *+2
    or.w     #$c0000,d7          ; this number willbe modified by the
                                 ; init routine
    move.l   d7,(a6)
....
```

You can also make sure the data for soundchip register 7 gets the right bits set in the music routine itself. Make sure you write all soundchip data to $ffff8800 and $ffff8802. On an ST you can write also data to the following adresses (so you can use a movem.l to set de soundchip registers (movem.l d0-a4,$ffff8800.w), but this will not work on a Falcon because the soundchip registers aren't mirrored anymore, instead of sound you will get a bus error on a Falcon. Second: the official hardware adress of the soundchip is $ff8800, but in all atari hardware it's also at $ffff8800. In the hades it's only at $ffff8800. This way they can use all memory as ST RAM and the RAM will be continues (otherwise there had to be a gap from 14Mb to 16Mb for the hardware registers and cardridge port and so on). SO you can savely use adress

$ffff8800 as soundchip adres.

Hope this helps, Hans Wessels

Dear Portfolio friend,
i hope you can answer me:
Can I change the ram cipset in my portfolio for more internal ram ?
Where I found a serial port for my portfolio ?
If yes How ?
Can you send me material about portfolio big write?
Have you the ATARI PORTFOLIO's electric map ?
I LOVE PORTFOLIO and I wount all material about it
I hope you answer me soon.

A Friend

It is only allowed under MultiTOS.

On normal TOS it won't work.
The problem is that most of the time you won't notice that it doesn't work.
Because they can't see any problems many programmers think that it works.
But belive me IT DOES NOT WORK !

TOS will think that the Malloc was done by the main application so if the
main application terminates TOS will make the memory free again. And
when the next application allocates memory....crasch....

 Well I was led to believe that STOS could be made to work on the
Madusa etc as soon as the author of the STOS Generic fixer finds
someone with such a machine that can offer 5 minutes of co operation,
this is one of the reasons we cannot support the TT, well someone has
come forward now so TT will be supported in the future, so presuming
the above is correct (Anthony??) then who needs GEM ?

Ah... well, I would say that is only necessary if it is to be labeled "the
perfect language for games". I would suggest that in the abscence of
any alternatives (which is what Tony was trying to establish), an imperfect
languague can still be the best...

True, but a statement like that is by definition subjective :-). How do
you measure the triviality or otherwise of a magazine?

> >although it did improve toward the end. I seem to remember an Atari

> agree are mostly hard drive owners?

Not true. I have only recently come on line (about 6 weeks ago) and I heard about it from about three different sources prior to the first issue (although one of them was a friend who had been e-mailed details :-)). I got the first issue before going on line.

> ST Format IMHO was by far the best magazine ever produced in the UK,
> it had everything, yes including mistakes,

I read ST Format from issue 1 of ST/Amiga Format and didn't miss an issue. In the early days I learned a lot about my computer from it but after a while they were simply recycling stuff that had been done before either by them or other magazines. They also never raised the level of expected user competency. It was great to have everything explained in noddy language to begin with but after a while I grew out of it. IMHO Format's credibility plummetted when Paula Richards was editor and never really fully recovered despite the valiant efforts of those that followed.

So why did I keep buying it? Well, there wasn't a lot of choice was there? I remember being very depressed when Review folded since the only support we were going to get was from Format. This may, of course, have had something to do with me spending GBP700 on a Falcon about a week before :-(. When Format went it was sad but didn't really hit me as hard despite it being the last UK news-stand publication.

As someone whose primary interest is games (I believe), I can see why you liked Format so much. However, even you must admit that hard-core games fans have become a little thin on the ground on the Atari in recent years. This is where Format's problems stemmed from. It's difficult to write about games when none are being released (though they had a bloody good try) and, IMHO, this was no longer an area where most of their readers interests lay.

Regards
Martyn

I've got a bit sick of using plain C, especially after working in C++ in work on PCs and unix machines, so I've decided to switch from Lattice to gcc/g++ for my atari stuff. I downloaded all ofthe latest bits and bobs from the umich mirror on imperial, and have managed to get gcc compiling (apparently quite happily). Unfortunately I don't seem to be able to get gdb to work with the rest ofthe tools. I've used sym-ld to generate a symbol table, but gdb keeps on telling me it can't read teh symbol table file, and suggesting I use the -mshort option (I've tried compiling with mshort, by the way, and usingthat, but gdb still gives the same errors). Unfortunately I don't have an atari to hand at the moment, so I can't remember the exact errors and version numbers (ie, the useful stuff :-), but does anyone recall any incompatibilities between gcc and gdb versions? Or have any ideas I might try?

Incidentally, how good is g++ on the atari? I use Borland C++ v4.5 on PCs, and the latest g++ on unix - what sort of things am I likely to find misssing? Any bugs I should look out for?

I'm not sure how frequently I can check this group, so I'd appreciate it if any replies could also be mailed to me at abaddon@nasoftwr.demon.co.uk

Thanks for any help,
Kev

Daniel is 100% correct, believe me. Never do a Malloc() in a desk accessory after the first AES call! Before that point is OK, as the memory belongs to the desktop. This does not apply if you are using Geneva or MultiTOS, since they both treat each process individually.

For a similar reason, you have to be careful when leaving files open (that is, they haven't been Fclose'd) in a DA. Let's say I open a file and then the user quits the main app. Since the file handle actually "belongs" to the app, the file is automatically closed by GEMDOS. If the DA then tries to use the file handle, it will get an error message at best or, at worst, start writing to a file that has since been opened by another app.

The moral of this story: always close files you open in a DA, or at least be aware that they may get closed for you. In fact, you can assume that if you have received an AC_CLOSE message and you are singletasking, that the file has been closed by GEMDOS for you. Don't try to write to the file after that point.

Hans, is there a small program to go in the AUTO folder and swithc off the
TT Speaker? I could unplug it, I suppose, but I hate to diable hardware
when software can switch it on and off. The reason I would ike to do it in
the AUTO folder is that I am running AWAV, and there's no volume control
until after GEM loads; I can control the external speakers easily enough
with the knob on the amplifier, but naturally that has no effet on the TT's

internal speaker.

I don't see why not. An ST could probably get away with it even
because there a lot less screen data to shift.

In article <Pine.BSI.3.95.961209130835.5160B-100000@usr05.primenet.com>
Katherine L Ellis <kellis@primenet.com> said:-

>Hi , WHat is the best way to manage memory in ACC?

The problem with Malloc in any accessory is down to multitasking. Even in standard gem this occurs, between the main application and the loaded accessories. Each process has a unique identifier which is written to a special place when a particular process is active. That way, when a process terminates the system resources allocated to it can be returned.

>I've read that Malloc is no good in ACC. True or not?

When an acc is loading it is the active process. Gem can only task switch when a program makes an aes call, appl_init() typically. Standard gem will *truly* taskswitch from an accessory to the main application but *never truly* back from the main application to *any* accessory. The end result is any memory obtained after appl_init() will almost certainly belong to the main process instead of the acc.

When the main process terminates, the accessory loses all memory it obtained after its first aes call but keeps what it obtained before its first aes call. When the next application is started - disaster, because both it and the acc are using the same memory area(s).

>If true what would be the solution?

The general solution is only to Malloc() before appl_init(). If your acc is unable to tell at load time how much mem it needs, you can do little more than provide a facility for the user to specify how much of a chunk it should get at this time then provide your own memory management routines. StiK for instance, does exactly this via the

ALLOCMEM variable.

A more specific solution for standard gem is to momentarily hack the accessory id into the memory location used for the active process. It works but requires some tricky programming because the memory location moves in different gem versions. Worse still - you must cater for all the different operating systems where the hack may or may not work at all. Magic for example, has no such problem - you can Malloc() as and when you feel like it anywhere in your accessory. As for MiNT and Geneva - I dunno about them.

>and could you show me an example, do I have to use reserve? inline? or
>what?

Dunno any GFA but you must ensure there are no Malloc() calls made after the first aes call, by you or internally by some GFA routine you might use.

Thanks for all the advice guys, especially Hans. I had thought register 7 of the psg was the root of the problem, but I didn't have any good source code examples to guide me. I'd actually disassembled part of the

TOS ROMs, I was so desparate. There in the system sound daemon I found the top two bits being always set, as John says. But it didn't work for me, I'm not sure why. Maybe it has to do with 'flock' as Peter says, but I thought that was just for DMA. At least that's what the Compendium says, though it's been wrong before.

While I'm grousing about confusing documentation, anyone ever notice that the psg register numbers in the Yamaha documentation supplied with the old developers' kit don't match those in the Compendium? Yet in this case the Compendium is apparently right and Yamaha wrong. Gah!

Anyway, here's the solution I came up with. It seems to work without stepping on the toes of any devices.

```
sound:   ; expects a0 to point to 14-byte sound packet, uses d0-d3/a1-a2
     move.w   #$-7800,a1    ; a1 -> psg reg select
     move.w   #$-77fe,a2    ; a2 -> psg data
     moveq    #0,d0         ; register counter
     moveq    #14,d1        ; for loop end test
     move sr,sr_0       ; store proc flags
     or   #$700,sr  ; disable interrupts
.loop:   move.b   d0,(a1)       ; send register number
     cmp.b    #7,d0         ; mixer control register requires
     beq.s    .is_7         ; special handling
.not_7:  move.b   (a0)+,(a2)    ; write to register
     bra.s    .comn
.is_7:   move.b   (a2),d2       ; read mixer control register
     and.b    #$c0,d2       ; mask
     move.b   (a0)+,d3  ; get our data
     and.b    #$3f,d3       ; mask
     or.b d2,d3         ; this way we write our six bits
     move.b   d3,(a2)       ; while leaving the other two alone
.cmn:    addq #1,d0         ; next register
     cmp.w    d1,d0         ; see if we've filled up to reg 14
     bne  .loop
     move sr_0,sr       ; restore proc flags
     rts
     . . .
sr_0:    dc.w 0
```

Now you are thinking a bit too simple. Maybe getting TOS data out of a Hades will fix STOS for a Hades (the cludge must go on). It still doesn't solve the problem of writing GEM games. The fact you don't like GEM doesn't mean other people don't want to write GEM games and secondly, the argument GEM being too slow is only a real concern for arcade games. Simulation, board and puzzle games don't need the blazing speed of direct screen manupulation. Why going not portable when you can write portable (=GEM conform) games? Especially when speed is not the main factor.
Secondly fixing STOS for a Hades does only mean that the program won't crash on a hades. Your games still won't work. New STOS upgrades are necesarry to get acces to the video memory of the Hades. So you have to own a Hades to write games in STOS for it. GEM games can be developed on every TOS compatible computer an will run on all other computers. (For the kintters among us: I am not telling Tony should write GEM games, nor that he should write games specially for the Hades. I am just telling that GEM programming is the way to go if a game should work on any TOS compatible machine.)

I think C is a good alternative. It will do all the GEM stuff. Doesn't need any fixing for TOS versions. And has the ability to do all the direct memory stuff needed for the fast arcade games. C isn't the perfect game language too, but is more all round than STOS is. I cam up a chess game written in C (GNU chess) and with serveral GEM games. The only thing I didn't show is an arcade game written in C that matches Tony's Heartland., On the other it is agreed STOS is useless for GEM. So I think C will be the best language to write games in and the only question that remains un answered is 'Can C beat STOS on the arcade game level?'.

It seems to me that you have disabled the disc drive. You see, one of the registers (I think its register 7) controls the PSG states. Now, the PSG has two parallel ports, Port A and Port B. I think (Dont have any docs with me at the moment! This is all from memory) Port B controls the disc drive.

With this you can toggle the drive lights on and off (cool!), turn the drive motors on and off, also you can very handily disable the drives.

So, to sum up, it seems that your code must be touching ports A and B. (regs 13 and 14). If you like, you could e-mail me some code (I will get back to you after the new year thogh!), and i'll do my best to sort it out!

Cheers,

Hello
    I use an atari falcon, I am wondering what the minimum specs (HD space, Ram etc) would be to run the following...

Minix (min partition size for a V2 filesystem)
XWindows (does this need mintnet, if so what does that need)
GCC (Space to run in...)

Currently I an using Mint V1.12 & Geneva 5 (GNVA_TOS.PRG still does not work though with mint miniwin works fine)

Basically I would like to know what I have to do before messing about with repartitioning my HD.

Also how do programs that don't know about long filenames cope under minix when given them? Does minix crop them to 8+3 or do you get rubbish? I.e. how useful is minix if you have older programs.

Thank you for any help either emailed to me or posted here.

Dale Needham

 Realy I think Anthony put it in the correct concept, he says what I
am trying to say, but him being educated was able to say it betterm

heheh

>needed for the fast arcade games. C isn't the perfect game language too, but is
>more all round than STOS is. I cam up a chess game written in C (GNU chess) and

 Her we go Chess again <G> excuse me but I see no reason why STOS
could not handle a chess game? although admittedly I have never had
the inclination to try evn though I am a Chess player,

>with serveral GEM games. The only thing I didn't show is an arcade game written
>in C that matches Tony's Heartland., On the other it is agreed STOS is useless
>for GEM. So I think C will be the best language to write games in and the only
>question that remains un answered is 'Can C beat STOS on the arcade game
>level?'.

 NO is a quick and easy answer :)

 Its been said, STOS is not perfect, but still the best around

 STOS is unrivaled in the catagories stated, ie: BASIC and C
 STOS Cannot do GEM
 therefore STOS is what? 90percent compatable, the only machines it
would fall down on are Hades and Madusa types, I dont think complaints
would come flooding in from those quarters?

 GEM made are fully compatable but can only handle board type games,
where STOS can handle arcade AND board type games?

 I still feel STOS would taking the above into consideration be the
wisest choice, The only draw back STOS has is a slight compatability
problem with SUPER comuters, the only drawback other BASICS and C have
is they cannot manage anything that needs speed,timing and power, the
choice is easy :)

Cheers.....!ynoT

I haven't got a program right of the shelf, but I did write two small programs for you doing the task. They both toggle the TT speaker on/off.

The first one is assembly:

```
                pea     fixit(PC)
                move.w  #$0026,-(SP)    ; Supexec
                trap    #14             ; xbios
                clr.w   (SP)            ; Ptrem
                trap    #1              ; Gemdos
fixit:
                move    SR,D0
                move    #$2700,SR       ; shutup interupts
                lea     $FFFF8800.w,A0  ; soundchip
                move.b  #$0E,(A0)       ; select register $0e
                move.b  (A0),D1         ; get current data
                eori.b  #$40,D1         ; toggle speaker bit
                move.b  D1,2(A0)        ; write new data
                move    D0,SR           ; restore sr
                rts                     ; done
```

It assembles into a 74 byte program. Purists will say it's a bit dirty. I agree with that.

The second one is in C:

```
/* toggle TT speaker on/of */

#include <tos.h>

int main(void)
{
  char data;
  data=Giaccess(0, 0x0E);    /* get data */
  Giaccess(data^0x40, 0x8E); /* write (data XOR $40) */
  return 0;                  /* exit succes */
}
```

It will be compiled into a program of about 500 bytes (depends on how smart the compiler and linker are).

The programs are not tested since I don't own a (working) TT, but I think they both will work.

I hope this information is enhough for you the get the speaker switched on/of with your own program. Otherwise drop me a message and I will mail you the program.

Bye, Hans Wessels

As always, more is better. 4 megs of RAM will work for what you want to do, but it'll be a tight squeeze. I've heard 10-15 megs as a minimum for a complete GCC/XWindow install, although that's likely on the small side.

: Minix (min partition size for a V2 filesystem)

There is, as far as I know, no minimum. There may be a maximum (512 megs, IIRC), but it's easily gotten around by using symbolic links to the unified file system to make the partitions transparent.

: XWindows (does this need mintnet, if so what does that need)

XWindow requires MintOS, which in turn should be used with MintNet.

: GCC (Space to run in...)

Can't say for certain, as I don't have GCC installed myself :P

[...]
: Also how do programs that don't know about long filenames cope under
: minix when given them? Does minix crop them to 8+3 or do you get
: rubbish? I.e. how useful is minix if you have older programs.

Programs that use the fileselector will work fine. Filenames are cropped to 8+3, and converted to upper case. Files with the first 8 characters identical, and identical extensions _can_ somehow be distinguished, despite the fact that they show up with identical filenames under the 8+3 convention. There are various options you can set to control the translation between TOS and MinixFS filenames, but I haven't played with them. Essentially, reading is virtually transparent, writing may not be so.

Atari 1040ST 1meg ram, dual floppies, color monitor, mouse, joy stic, software atari 1st word, vip proffesional, starglider, flight sim, and other games, all original doc's and software, everything works fine, is in very good shape,
This is a nice machine, but just isn't being used, won't to sell, will

ship COD + shipping, make an offer.

MIDI Switching Box Plans For Sale

Have you ever fumbled around unplugging and plugging in MIDI cables from one device to another? Here is a fast, easy way to switch MIDI cables on computers, synthesizers, samplers, drum machines, effects boxes; any MIDI device. It eliminates the need for swapping cables. Anyone with more than one MIDI device should have one or more of these. Professional and home recording studios will find this item indispensable.

The MIDI Switching Box (MSB) can be used for a number of varied and useful applications, from a simple MIDI on-off switch, to a switching component in an advanced MIDI studio. You will find many uses for this simple and economical device. We use them all the time to quickly reconfigure MIDI devices in the studio.

While you can buy a MIDI Thru Box that will split a MIDI output signal into four

or more outputs, it will NOT reroute data from one place to another. You need a switch box for this.

So, if you want to reroute MIDI data from one device to another, you can:

1) Get up, reach around your equipment, and unplug and plug your cables,
2) Buy an expensive electronic switcher,
OR
3) Build the MSB, and reroute your MIDI data stream simply by throwing a switch.

Swapping cable hassles are history!

Here are some things you can do with the MSB:
1. Switch a slave keyboard (or any MIDI device) on and off.
2. Switch a master keyboard to either of two slave keyboards/modules.
3. Switch a master keyboard to either a slave keyboard or sequencer/computer.
4. Switch a slave keyboard to either a master keyboard or sequencer/computer.
5. Switch a sequencer/computer to receive MIDI from either of two keyboards.
6. Design any other configuration, depending on your needs.

Assembly is straightforward, just a few tools and soldering iron, and should take less than an hour. All part are available at your local electronics store for under $10.

Complete building instructions, parts list, and studio configuration diagrams included.

MIDI Switching Box Plans

On the night of posting the first article I tried to get things working
The version of minit.ttp I had is old, it will not protect the file
system. It comes up with the error that it needs 512byte sectors for a
null file system. How big is a partion this size?

I also have a newer version of minit.ttp, which runs fine, V2 file
system the lot including protection, however it crashes about 5 seconds
after accessing a minix partition every time.

I have no problems with mint, it runs fine. Both the version with multitos and 1.12 that came with geneva 4. However the GCC doc files state that a real file system is needed, i.e. minix given the problems I have getting that to run and stay running does anyone know of a way to get this to work on a falcon?, P.S. the "mint distribution kit" has a good install package, which also doesn't work on a falcon....

[probably the falcons fault, maybe I should have upgraded my old 520STFM to 4 Meg after all, still don't like the idea of de-soldering the video shifter however.....]

If anyone has got GCC running on a falcon please, please help....

Thank you

Dale Needham

Sectors are always (or nearly always) 512 bytes. They can be clustered to
increase the partition size. In any case, you should be using the newest
version of minit and related utilities.

: I also have a newer version of minit.ttp, which runs fine, V2 file
: system the lot including protection, however it crashes about 5 seconds
: after accessing a minix partition every time.

What hard disk driver are you using? Many people (myself included) have
problems using the ICD drivers, especially on larger (i.e., formerly BGM)
partitions. Recent versions of AHDI, CBHD, and HDDriver should work fine.

: I have no problems with mint, it runs fine. Both the version with

A better choice, if you want to go the route of a distribution kit, might be Knarf's German Mint Distribution (most recent), or (slightly less recent) the TAF distribution kit.

: [probably the falcons fault, maybe I should have upgraded my old 520STFM
: to 4 Meg after all, still don't like the idea of de-soldering the video

Trust me, running Mint on an 8 MHz machine is not fun. Nor is doing development work without memory protection. Your Falcon is definitely a better Mint platform.

That should do it. Since the whole thing uses only integers, even GST C
should compile it. I'll give it a try tonight, thanks!

>
> GEM made are fully compatable but can only handle board type games,
> where STOS can handle arcade AND board type games?

STOS was not written to use GEM for very good reasons:

1) It came out a while ago so less than 512Kb RAM available on 520's -
   even less under GEM!!!
2) Having to wait for GEM to load up - even worse if TOS was on disk :)
   (Non-GEM means able to be run from bootsector loader or auto-folder)
3) Booting the game on a clean system meant that compatibiltiy is *increased*

What other commercial games of that time run under GEM? Not many! Actually,
even some modern games have problems with GEM/accessories/etc.

The GEM version of "nethack" which was written to run on all GEM machines has major problems on certain falcons reading the mouse & keyboard! It was written in C and still can't get 100% compatibility. I don't think you can ensure 100% compatibility no matter what language you write in.

Look at the PC scene... most games are not designed to run under windows (a DOS shell in windows maybe - but then it's still under DOS)

Even when coding in C or 680x0 I wouldn't choose to write arcade games in GEM - simply because it would be too slow!

BTW: STOS runs fine under the STonX emulator on PC linuxboxes & Suns :)

Now can this thread die in peace?

Just my 2c worth...
Yiannis

[snip]

You say the safe point for malloc in an ACC is before the very first AES call. But the way I had learned, you do a wind_update(BEG_UPDATE) first (after appl_init, obviously, but before entering the evnt_multi loop of the ACC) - which will hold the GEM Desktop since it too will call wind_update(BEG_UPDATE) before drawing the desktop on screen. You can then let your ACC undisturbed do malloc and load files and, only when this is done, call wind_update(END_UPDATE) to release the screen and let the Desktop proceed with its initialization.

The argument against this use of wind_update(BEG_UPDATE) is of course that it isn't exactly what it was intended for: signalling the intent to draw on the screen (which our ACC won't do), but it works anyway since the GEM Desktop should always call it before drawing the desktop. (Except I heard there was a bugged version of TT TOS that didn't call wind_update before drawing.)

But maybe my learning is old. Is it equally safe (or safer?) to do these things simply before the very first AES call?

Sorry, but this is wrong. Memory allocation has nothing to do with=20
drawing on screen. Deducting that you may call Malloc because the screen=20
is locked is wrong.

The culprit for the problem with the Malloc is that GEMDOS (Malloc is a=20
GEMDOS call) is a single-tasking system that does not know anything about=
=20
the multi-tasking capabilities of GEM-AES. That leads to the situation=20
that two programs (the main application and your accessory) can be=20
running, with the app being able to terminate. GEMDOS does not know that=20
there is more than one program running, so any Malloc'ed memory blocks,=20
regardless whether ordered by the app or the accessory, belong to the one=
=20
program GEMDOS thinks it is running. If the main app terminates, GEMDOS=20
releases all these blocks, because it thinks the one program is gone.=20
However, the acc is still there and might proceed accessing the memory=20
it ordered, which is illegal now, because GEMDOS released it, and thus=20
leads to a crash.=20

Thus the only thing that counts is whether the app that is running at the=
=20
time the acc does the Malloc, is capable of termination, or not. If you=20
do the Malloc before the first AES call then it is the AES themselves that=
=20
constitute the program, and the AES will never terminate.

If you do it any time later then there might be another program running=20
which eventually will terminate, and cause a crash this way.

Deducing that you may stop execution of the desktop before another=20
program can be started by calling wind_update is nonsense. Already with=20
TOS 1.4 (AES V1.4) the AES can auto-start an application instead of the=20

desktop, which can be terminated. So again a crash will follow if this=20
happens and the accessory had the silly idea to call Malloc and frame it=20
with wind_update.

Cheers Peter

Hiya

I have had a wierd problem under Lattice C with using the
fopen (or Fopen) call. I have a structure which contains
info about the contents of a window, which includes the
filename which it is associated with.

With the following code the fopen fails, with _OSERR
indicating file-not-found, but only the first time it
is called (subsequent calls succeed)...

```
handle=fopen(cur_wind->filename,"ra");
```

while the following code always works:

```
strcpy(tempstring,cur_wind->filename);
handle=fopen(tempstring,"ra");
```

anyone got any ideas why this is? is it a bug in
lattice or something?

Anthony

Hi,
To be short. I'm looking for a way to get into object oriented programming for the Falcon. I have Pure C but pherhaps a C++ compiler makes it more easy. If anyone has experience with this sort of programming, can you please help me out and get me started.

I already programmed with (spit) MSVC++ 4.2 (spit). Although this is a (spit) Microsoft (spit) product, it still is better than writing tons of listings nobody else can understand.

Pherhaps with the C++ compiler you could have the same sort of programs for Atari as Delphi and stuff like that. This would mean more Atari software could be made.

Otherwise I should get as much libraries as possible to use them for making software.

Thanks for your attention

For those who might possibly be interested, an _informal, non-official, non-Apple-sanctioned_ discussion about the design of a new graphical user interface and windowing system for the next generation of Macintosh operating system is talking place on the GX dev mailing list and the AIMED-talk mailing list [see sig for subscription info].

Background:

Apple Computer's attempts to create a transitional operating system have failed, at least partly due to a lack of a pre-emptive multitasking-enabled graphical user interface and windowing system in their transitional OS design.

The design of Apple's original graphics library [QuickDraw] didn't allow for a simple transition to PMT, and the shipment date for their transitional OS slipped beyond commercial viability. To make matters worse, former management didn't have a fully-PMT GUI waiting in the wings, so now Apple is without a transitional OS *or* a full-featured OS.

Fortunately, Apple has available the most powerful 2D graphs library ever implemented on a desktop system: QuickDraw GX.
